2.90. Some contemporary Anti-G suits incorporate features to assist the wearer in breathing high pressure gasses or to provide protection against exposure to very low air pressure environments. Such features are beyond the scope of this section. Advice should be sought from ALSLMU prior to using such equipment on ADF aircraft.

2.91. **Design Requirement (Recommended).** *Anti-G suits should be subjected to scheduled fit checks on the assigned wearer, by a suitably qualified person.*

2.92. **Design Requirements (Recommended).** *Anti-G suits should be subjected to pre-flight functional and/or leak checks.*

(a) **Guidance Material.** The preferred method of compliance is to conduct a functional check which can be conducted in an aircraft with the wearer of the suit strapped in such that the suit is integrated to the aircraft. If a pre-flight check in a carrying aircraft is not feasible, then a functional and/or leak check should be conducted when the suit is donned.

2.93. **Key Considerations.** The following key considerations should be made when introducing Anti-G suits to ADF service:

(a) An Anti-G suit with greater coverage of the wearer will tend to offer superior protection against G forces, whilst an Anti-G suit with a larger total bladder volume will inflate more slowly. High coverage and rapid inflation are both desirable properties of an Anti-G. These characteristics should be considered and optimised for the intended configuration, role and environment of the user.

(b) The use of 'pull away' quick release connectors for the interface between an aircraft and an Anti-G suit are considered desirable for the purpose of rapid emergency egress, but an inadvertent disconnection in flight could contribute to a G Induced Loss of Consciousness (G-LOC) event. The selection of an interface connector should consider both emergency egress and the security of the connection.

(c) The wearer of an Anti-G suit should conduct activities such as the Anti-G Straining Manoeuvre (AGSM) to resist the effects of G forces. Different Anti-G suit designs afford varying levels of protection against G forces and caution should be applied when transitioning from a design with a high level of protection to one with lesser protection. The wearers AGSM activities should be matched to the assistance provided by the suit. Effective conduct of an AGSM with a particular Anti-G suit design requires substantial practice and conditioning. For this reason, care should be taken when considering any finding of equivalence between the function and performance level of different Anti-G suit designs.

(d) The failure of an Anti-G suit could contribute to a G Induced Loss of Consciousness (G-LOC) event. The reliability of an Anti-G suit should be considered in terms of the suit making up part of the carrying aircraft's Anti-G system.

Life Preservers

2.94. Life preservers provide individuals with floatation support whilst in the water following a survivable aircraft ditching. They have inflatable buoyancy chambers to minimise bulk during normal operations and may incorporate survival aid stowage as part of the assembly. The type of life preserver used is highly dependent on the CRE of the host aircraft and the personnel that it is intended for including aircrew and passengers (combat/noncombat).

Superseded

Constant wear life preservers

2.95. **Design Requirement (Essential).** *Constant wear life preservers must comply with the requirements of DEF(AUST) 9202.*

(a) **Tailoring advice.** Replace the second sentence of paragraph 2i of AIR STD ASM 4065 Ed1v3 as follows: "The life preserver must accommodate the full anthropometric range of the user population wearing standard flight clothing and applicable personal survival equipment".

Non-constant wear life preservers

2.96. **Design Requirement (Essential).** *Non-constant wear life preservers must comply with the requirements of TSO-C13g.*

General life preserver requirements applicable to all life preservers

2.97. **Design Requirement (Essential).** *Life Preservers for Rotary Wing aircraft applications must only use manually activated inflation devices and be inflated by the wearer following egress from the aircraft so that the buoyancy of an inflated life preserver does not trap them within a sinking aircraft.*

2.98. **Design Requirement (Essential).** *Life Preservers for ejection seat aircraft must use automatically activated inflation devices that automatically inflate once in the water to account for the possibility of unconsciousness following the ejection sequence.*

2.99. **Design Requirement (Essential).** *The life preserver must be fitted with a pea-less whistle unless the life preserver is for an infant. The whistle must be secured by a cord to the life preserver.*

2.100. **Design Requirement (Essential).** *The life preserver in the inflated mode must not hamper ingress to single or multi-seat life rafts.*

2.101. **Design Requirement (Essential).** *All inflatable life preservers must use dual chamber buoyancy systems to provide redundancy for damage or failure of one chamber.*

2.102. **Design Requirement (Recommended).** *The buoyancy afforded by a life preserver should consider the additional equipment weight carried by the wearer (e.g. fully loaded combat passengers).*

2.103. **Design Requirement (Recommended).** *Life preservers should be protected against inadvertent inflation.*

2.104. **Design Requirement (Recommended).** *A life line and toggle should be fitted to the life preserver. Where fitted, the life line must have a minimum breaking strain of 45 kg and be approximately 1 metre in length. The life line and toggle are to be stowed within easy reach of the wearer.*

(a) **Guidance Material.** This requirement provides a means for survivors to tether themselves together if they are in the water and do not have a life raft (e.g. survivors could not remove the life raft from a sinking helicopter).

2.105. **Design Requirement (Recommended).** The life preserver should be compatible with helicopter rescue hoisting operations.

2.106. **Key Consideration.** DASDRM Section 2 Chapter 6 Annex A should be referenced for guidance on life preserver stowage on aircraft and quantity of life preservers required.

2.107. **Key Consideration.** The requirement for infant and child life preservers should be assessed during the procurement process based on the expected role of the aircraft.

Superseded

2.108. **Key Consideration.** The MAO should consider if subsurface buoyancy is required for the life preserver application.

2.109. **Key Consideration.** Civilian passengers may not be fluent in English language and/or may not be able to read English which may cause difficulties for the passengers accessing and using the life preserver.

Life Rafts

2.110. Life Rafts provide for survivability of one or more people after an aircraft evacuation over water, or dropping from an aircraft to survivors in the water during Search and Rescue operation. Once boarded, life rafts increase survivability by isolating survivors from the water and providing shelter from the environment. Life raft designs must cater for Defence's survivability needs ranging from hours to days of life support, incorporating communication and rescue aids, rations and water treatment systems where warranted.

2.111. Life Rafts and their components must comply with ALSE General Requirements as well as the following standards as relevant to the specific Defence aircraft installation, considering recommended requirements and guidance material listed.

Life Raft Equipment

2.112. **Design Requirement (Recommended).** The following life raft specific survival aids are strongly recommended as inclusions with all life rafts.

(a) at least one buoyant bailer.

(b) a pair of buoyant paddles (note: not appropriate for larger life rafts).

(c) an efficient radar reflector or a radar transponder.

(d) anti-nausea medication and sick bags for all on board the life raft.

Multi-seat life rafts

2.113. **Design Requirement (Essential).** *Life rafts must comply with TSO-C70b.*

2.114. **Design Requirement (Recommended).** *Life rafts should consider fitment/use of the following recommended features:*

(a) *Life Raft lights should have batteries (or battery and Light units) that are replaceable without the use of adhesives.*

(b) *Attachments should be provided to keep the entrance covers open (the life raft should be packed in this position if a self-erecting canopy is fitted).*

(c) *The total seating space should be insulated by an inflatable floor. When a removable mattress type is supplied, tie down points to attach the mattress to the life raft floor should be added.*

(d) *The floor should be fitted with Inflate/Deflate valves that are compatible with the Life Raft Topping-up valves and the Life Raft Hand pump. When a mattress type inflatable floor is supplied, the upper side centre of the floor (when installed) should be stencilled with 40 mm high lettering 'INFLATABLE FLOOR'.*

(e) *The life raft should provide sufficient air for the occupants at all times, even with the entrances closed.*

(f) *The life raft should contain a viewing port.*

Superseded

(g) *Where the life raft has multiple entrances, best practice is to have at least one entrance provided with a 'boarding ramp', with other entrances using a 'boarding ladder' style boarding aid. The boarding ramp should not cause life raft deflation if it becomes damaged and the lowest step of the boarding ladder should be .4 m below the life rafts waterline.*

(h) *Have an automatically deploying sea anchor or a labelled reminder for the occupant to deploy the sea anchor.*

2.115. **Design Requirement (Recommended).** *Life rafts which can be externally mounted and deployed remotely should be used in preference to internally installed life rafts which require physical effort to deploy. Internally installed life rafts should have unobstructed access from the inside of the aircraft and that of the ditched position.*

(a) **Guidance Material.** Life rafts should be deployable from three locations being in reach of the flight crew, occupants of the passenger cabin and survivors in the water with the aircraft floating in the ditched/capsized position.

2.116. **Design Requirement (Recommended).** *Life rafts should be equipped with two retaining lines to be used for securing the life raft to the aircraft, one short line and one long.*

(a) **Guidance Material.** A short line holding the life raft close enough for occupants to enter the life raft directly without entering the water which is then cut leaving the life raft attached to the aircraft by the longer retaining line which should allow the life raft to float at a safe distance away from the aircraft.

2.117. **Guidance Material.** Aircraft should have a minimum of two life rafts with sufficient overload capacity to account for the loss of the largest life raft.

2.118. **Guidance Material.** Consideration should be given to whether additional capacity within the life rafts is required to account for operationally kitted aircrew.

2.119. **Guidance Material.** Weight and space permitting, consideration should be given to increasing the puncture resistance of the life raft if it is located in close proximity to an area of the aircraft which is likely to have jagged edges following a water landing/ditching.

2.120. **Guidance Material.** Consideration should be given to whether there are entanglement possibilities from lines/boarding ladders which could trap a person while righting the life raft during a new life rafts introduction to service.

Multi-seat life raft compressed cylinders

2.121. **Design Requirement (Essential).** *Compressed cylinders which have been discharged, immersed in water, visually appear corroded, out of limits or damaged and will (or have) exceeded the 5 years since hydrostatic test must be returned for inspection, testing and refilling. Facilities conducting the work must satisfy the requirements of AS 2337.1 for Gas Cylinder Test Stations, Part 1: General Requirements, Inspection and Tests–Gas Cylinders.*

2.122. **Design Requirement (Essential).** *Recharging and reconditioning, internal and external inspection and testing of Inflation System Compressed Cylinders must comply with AS 2337.1.*

2.123. **Design Requirement (Essential).** *Each cylinder must be charged with the required weight of CO2 and N2 as applicable by the type of cylinder, to within the limits as specified by the manufacturer. CO2 used must conform to BB–C–101, Grade B. Where additional pressure to expel CO2 at lower*

Superseded

temperatures is required, cylinders must have added Dry N2 conforming to A–A–59503, Type I, Grade B, Class 1.

2.124. **Design Requirement (Recommended).** *Painting of the compressed cylinder should be done in accordance with MIL-STD-1411A. The threaded portion of the neck of the cylinder should not be painted.*

2.125. **Design Requirement (Recommended).** *Cylinders fitted with syphon tubes should have the type of syphon tube clearly stencilled in 12 mm lettering, in Black Cellulose Lacquer conforming to A–A–3165, longitudinally on the body of the cylinder, as* applicable.

Single seat life rafts

2.126. **Design Requirement (Essential).** *Life rafts must comply with DEF(AUST) 9203.*

2.127. **Design Requirement (Essential).** *Inflation compressed cylinders must comply with MIL-PRF-25369D(1).*

LOAD CARRIAGE AND RESTRAINT DOMAINS

Carriers

2.128. Carriers form the basis of an ALSE Ensemble in that they provide a platform to which various ALSE can be attached. Carriers take two forms a vest (for non-load bearing applications) or harness (for load bearing applications for restraint / hoisting). Selection of a carrier requires consideration of the requirements of the wider ensemble and the need for restraint/ hoisting capability.

2.129. Design Requirement (Essential). *A carrier must be designed to restrain the load of any ALSE component or combination of components intended to be attached to it simultaneously under relevant crashworthiness loads defined in the relevant aircraft(s) type certification basis or derived from the Section 2 Chapter 6 Contemporary Crash Protection Requirements.*

(a) **Guidance Material.** Where a Harness is required any relevant Out of Seat Restraint or Hoisting Equipment requirements should be applied from the respective Domains.

Hoisting Equipment

2.130. Hoisting Equipment is considered as any equipment that is connected to a rotary wing aircraft's hoist for the purposes of deploying and recovering personnel to/from the aircraft during flight. This ALSE domain includes but is not limited to harnesses, strops, baskets, seats and stretchers. This ALSE domain does not include the aircraft hoist, cable or hoist hook.

2.131. **Design Requirement (Essential).** *Harnesses must meet the requirements of ATSO-C1003 or TSO-C167 as tailored below:*

(a) Para 3 (1) of ATSO-C1003 should refer to AS/NZS 1891.1:2020 and use the applicable sections for Full Body Harness.

(b) Para 3 (3) of ATSO-C1003 shall refer to Section 2.2.3 of AS/NZS 1891.1:2020 instead of 4.2.3 of AS/NZS 1891.1:1995.

(c) Para 3 (4) of ATSO-C1003 shall refer to Section 5.1 paragraphs c, f, g, h of AS/NZS 1891.1:2020 instead of 5.1 of AS/NZS 1891.1:1995.

Superseded

(d) Para 3 (5) of ATSO-C1003 provides dispensation from permanently marking harnesses with a maximum allowable free fall as required by AS/NZS 1891.1:1995. This dispensation still applies to harnesses; however, AS/NZS 1891:2020 does not include this requirement.

(e) Para 3 (6) of ATSO-C1003 refers to Static Tests for Lanyards. These tests are not applicable to harnesses.

(f) Dynamic testing of harnesses must be performed as per AS/NZS 1891.1:2007 Appendix D.

2.132. **Guidance Material.** ATSO-C1003 is no longer a stand-alone document. It was moved to CASR Part 21 Manual of Standards (MOS). Latest revision of MOS is dated 30 Nov 17.

2.133. **Design Requirement (Essential)**. *Rescue Strops must meet the requirements of ATSO-C1003 as tailored below:*

(a) In reference to Para 3 (2) of ATSO-C1003, use the applicable sections in the AS/NZS 1891.1:1995 standard for "Retrieval Strap" testing. General, webbing and attachment hardware requirements used in the Strop shall be as required for harnesses in AS/NZS 1891.1:2020.

(b) Para 3 (3) of ATSO-C1003 shall refer to Section 2.2.3 of AS/NZS 1891.1:2020 instead of 4.2.3 of AS/NZS 1891.1:1995.

(c) Para 3 (4) of ATSO-C1003 shall refer to Section 5.1 paragraphs c, f, g, h of AS/NZS 1891.1:2020 instead of 5.1 of AS/NZS 1891.1: 1995.

(d) Para 3 (5) of ATSO-C1003 shall refer to Section 5.2 of AS/NZS 1891.1:2020 instead of 5.2 of AS/NZS 1891.1:1995.

(e) Para 3 (6) of ATSO-C1003 refers to Static Tests for Lanyards. These tests are not applicable to rescue strops.

2.134. **Guidance Material.** ATSO-C1003 is no longer a stand-alone document. It was moved to CASR Part 21 Manual of Standards (MOS). Latest revision of MOS is dated 30 Nov 2017.

2.135. **Design Requirement (Essential).** *Hoisting equipment other than rescue harness/strops must meet the applicable requirements of NFPA 1983:2017 and ATSO-C1003 Paragraphs 3(8) and 3(9).*

2.136. **Design Requirement (Essential).** *A Rescue Strop must be buoyant for maritime operations.*

2.137. **Design Requirement (Recommended).** *The Rescue Strop should be a bright colour to enhance conspicuity during rescue.*

2.138. **Tailoring Advice.** This requirement is deemed recommended since there may be cases where a strop is required for Combat Search and Rescue (CSAR) operations where bright colours are not suitable.

2.139. **Design Requirement (Recommended).** *Where likely to be used for hoisting of hypothermic patients a Rescue Strop should incorporate a Hypothermia strap (a secondary strap placed under the knees of the hoistee for a semi-recumbent position).*

2.140. The current version of FAR 29.865 is Amendment 29-43. Advisory Circular AC29-2C contains detailed guidance at AC29-865B. Within FAR 29.865 Harnesses, Rescue Strops (along with other Personnel carrying devices) are collectively referred to as Personnel Carrying Device Systems (PCDS). The following sections are considered applicable to PCDS:

Superseded

(a) FAR 29.865(a) The requirement for PCDS to be shown by analysis, test or both to withstand limit static load to a load factor of 3.5 or some lower factor not less than 2.5. AC29.865B provides guidance at paragraph d.(6) and in particular d.(6)(ii)(B) for Human External Cargo. Sub-Para (1) provides for a static analysis to show compliance if a safety factor of 3.0 is applied. Sub-Para (2) identifies use of a conservative load factor of 3.5g or substantiated lower factor not less than 2.5g and Sub-Para (3) identifies the use of a 101kg person as the minimum weight however a note indicates additional equipment weight should be included. In the ADF context it is not uncommon for Aircrewmen with equipment and wet to weigh 150kg. Using these values gives a static load of 150 kg x 9.81 m/s2 x 3.0 x 3.5 = 15.5kN. Given that it is not expected that the helicopter would intentionally operate anywhere near the conservative 3.5g load factor during hoisting operations it is calculated that a load factor of 3.39 (equating to 15kN) would suffice. It is therefore considered that the static load testing of the Harness or Rescue Strop to AS/NZS1891.1 requirement of 15kN will satisfy this requirement.

(b) FAR 29.865(c) (2), these requirements are considered to be satisfied by a Harness or Rescue Strop that meets the tailored requirements of ATSO-C1003 or TSO-C167.

(c) FAR 29.865(c)(3), these requirements for placards/markings for operating, ingress and egress instructions are likely to have been met by requirements of either ATSO-C1003 and AS 1891.1:2007 or TSO-C167 and its reference standards.

(d) FAR 29.865(f), this requirement is for fatigue evaluation in accordance with FAR29.571 to be applied to the PCDS. Guidance at AC29.865B paragraph d.(6)(vi)(B) indicates analysing the PCDS component by component to determine fatigue critical components to be subject to analysis or test to determine fatigue life limits. As it is difficult to analyse the fatigue response of webbing and material type harnesses and strops one approach considered suitable by the Standards DoSA-ALSE would be to conduct cycle testing of the entire PCDS system based on the critical load factors (excluding the safety factor used for ultimate load) and make a determination of the number of hoisting cycles likely to be experienced by the PCDS during its life. Using a weight of 150kg and conservative load factor of 3.5g the fatigue cycle load to be used would be 150kg x 9.81 m/s2 x 3.5) = 5150N. Generally Harnesses and Rescue Strops are have a service life of 10 years (unless otherwise substantiated) so using this and the number of hoisting cycles the equipment is expected to be used (under load) a number of cycles can be determined for testing.

2.141. **Key Considerations.** The following key considerations should be made when introducing hoisting equipment:

(a) Rescue Strops are designed for ease of donning whilst in the water but do not provide the safest option for restraint during hoisting. Strops require the hoistee to hold their arms down to maintain restraint. It is possible if the arms are lifted that the hoistee may fall from the restraint which is known to have occurred in the event of a hoistee becoming unconscious (refer ATSB Aviation Occurrence Investigation Report AO-2013-136). Prior to a Rescue Strop being used the following considerations should be made:

1. whether life is at imminent risk
2. the state of the person to be winched, particularly whether the winchee will remain conscious and coherent during the winch process
3. the potential for the person to remain compliant with winching brief
4. alternative methods and devices to recover the person

Superseded

5. whether the risk of falling from the device would not result in further serious injury or death.

(b) Rescue Strop design or operating procedures should prevent a survivor from slipping through the rescue strop during winching. It should be considered if any additional design features for a Rescue Strop such as arm straps (to help hold arms down over the strop), crotch straps, self-securing systems and anti-slip materials to prevent slipping from the Rescue Strop are suitable for the application's Configuration, Role and Environment.

(c) Use of a Rescue Strop with hypothermic strap is considered a safer option compared to a single under arm strop, especially with heavier winchee's or those who may have pre-existing heart-related medical conditions, or suffering hypothermia.

(d) Rescue Strops should be chosen as a 'last resort', in favour of using extraction devices which will not allow the winchee to fall out. Additionally, best practice is using strops only over water.

(e) A Rescue Strop should be sufficiently long to fit around the chest of a survivor carrying full aircrew clothing and accoutrements (additional equipment) after immersion in water.

(f) The option of an emergency quick release device fitted between the harness and hoist hook should be considered as part of a safety argument that supports the determination that associated risks have been eliminated or otherwise minimised SFARP. If a quick release is to be used the ATSO-C1003 paragraph 3(7) requirements are considered essential design requirements.

(g) The strop or harness should be adequately comfortable and suitable for the wearer as to not injure the wearer during a lift.

(h) The weight of a rescue strop should be selected to limit flail of an empty strop when attached to a hoist hook and hoisted in the aircraft's rotor wash and this should be assessed by flight test. The weight will need to be balanced with buoyancy of the strop to ensure it floats on the water for ease of use during a water hoisting operation. Alternatively the use of a separate weight attached to the hoist hook to weight the cable and limit movement of an empty strop in the rotor wash could be considered.

(i) Where a Harness is to also be used for restraint whilst out of seat within an aircraft the requirements prescribed for Out of Seat Restraint Systems will also need to be considered and applied to the design.

(j) To prevent a rescue device from spinning, the use of an integrated tagline or litter drag chute should be used to assist in stabilising the equipment and patients during the hoist.

(k) Selection of hoisting equipment should be considered in the context of an SFARP solution for the application, configuration, role and environment.

Out of Seat Restraint Systems

2.142. A fall restraint system consist of an anchor point, connectors, full body harness and may include a lanyard, lifeline, or suitable combinations of these. The entire system must be capable of withstanding the impact forces involved in stopping or arresting a fall. When operating out of seat a restraint strap does not provide crashworthy restraint and personnel will be subject to flailing within the extent of the restraint length. When not operationally required to be out of a seat personnel should return to a seat restraint as required by DASR ORO.70(b).

Superseded

2.143. Restraint systems shall primarily be designed to keep personnel within the designated safe bounds of the aircraft at all times. There may be particular cases however where personnel need a length of restraint to achieve a required positioning where the restraint length could place the personnel at a fall risk position. (For example a helicopter Aircrewman conducting clearances by lying on their stomach to look out the door and underneath an aircraft. In this example when moving from lying to standing position the restraint length could allow the standing Aircrewman to exit the door).

2.144. **Design Requirement (Essential).** *Out of Seat Restraint systems must meet the requirements of the following standards:*

(a) *ATSO-C1001, Dispatcher's Restraint Strap. With the following tailoring:*

1. *Para 3(1) should read: Subject to subclauses (2) to (6), the dispatchers restraint strap must meet the requirements mentioned in AS/NZS 1891.1:2007 relating to lanyards*
2. *Para 3(2) should refer to clause 2.2.1 of AS/NZS 1891.1:2007 instead of 3.2.4 of AS/NZS 1891.1:1995. It is noted that designs incorporating a three ring disconnect include a small eyelet in the load bearing webbing, this may be accepted so long as strength and wear requirements are met*
3. *Para 3(2)b shall refer to the requirements 4.4.1 of AS/NZS 1891.1:2007, tested in accordance with Appendix G of AS/NZS 1891.1:2007*
4. *Para 3(3) should refer to clause 2.3 of AS/NZS 1891.1:2007*
5. *Para 3(6) should refer to the test at Appendix G of AS/NZS 1891.1:2007 instead of Appendix D of AS/NZS 1891.1:1995*
6. *Para 6 should refer to AS/NZS 1891.1:2007 instead of AS/NZS 1891.1:1995*
7. *The ATSO required quick release strap may be optionally omitted for platforms which would not gain significant advantage from the implementation of a quick release device. This is to be determined by the MAO, it is anticipated that all rotorcraft will incorporate a quick release device, whereas large fixed wing aircraft will likely forgo this requirement.*

(b) *AS/NZS 1891.1:2007 Industrial fall-arrest systems and devices – Harnesses and Ancillary Equipment; (As tailored by ATSO-C1001)*

1. *All requirements relating to the use of personal energy absorbers shall also be removed from AS/NZS 1891.1:2007.*
2. *The requirements relating to the adjustment of a pole strap found at clause 4.3.2 of AS/NZS 1891.1:2007are deemed as essential, and shall be applied to the lanyard assembly used. The lanyard length must be conveniently adjusted with self-locking connectors that do not cause damage to the lanyard. The release of these connecters must require consecutive deliberate actions in accordance with clause 5.2.1 of AS/NZS 1891.1:2007.*

2.145. **Design Requirement (Recommended).** *All parts of the restraint should be flame resistant in accordance with the general requirements for life support equipment section 2.19 of the DASDRM, therefore the out of seat restraint system should be FAA Part 25.853 compliant.*

2.146. **Key Considerations.** The following key considerations should be made when introducing out of seat restraint equipment:

Superseded

(a) Platform specific variation will occur. Consideration of the platform specific environment when applying the working at heights code of practice and related standards should be undertaken in each case.

(b) Where working at height standards are used they must be appropriately tailored to an aviation context as aircraft are dynamic platforms and falls can occur in multiple directions and in succession.

(c) A crew member should be able to easily move about the cabin and access all required equipment for their duties, but movement should be restricted beyond the required range of motion to avoid injury under extreme flight conditions or in a crash/hard landing.

(d) Cargo, role equipment and personnel should be appropriately spaced to minimise the likelihood and severity of potential impact should adverse flight conditions be encountered while a user is reliant on out of seat restraints. Consideration should also take place to ensure that adverse reactions such as rubbing and snagging on obstacles so as to avoid minor injuries to personnel or damage to the restraint system. Additionally users operating out of seat should be aware of their surroundings and should have the ability to secure themselves by using hand holds or other means in the event of unexpected turbulence being encountered.

(e) Crew should be able to adjust their lanyards quickly and efficiently, this will assure that they will adjust their lanyards constantly and keep them correctly set as they move about the airframe and conduct varying roles. These mechanisms should not be prone to inadvertent length adjustment. The restraint system should be designed in such a way that it prevents a user from gaining excessive momentum in the event the aircraft accelerates rapidly. This must be balanced with the need to move about the cabin.

(f) As recommended by CASA Airworthiness bulletin 25-007, Restraint straps and harnesses should remain connected to an approved hard point at all times during flight. The use of hard points that are located at height either on a wall or overhead is preferred over the use of a floor based point.

(g) As recommended by the Canada National Defence Airworthiness Design Standards Manual more stringent civilian type “full body’ harnesses incorporating leg and shoulder straps should be used wherever operationally possible as opposed to belt or lower body harnesses.

Ballistic Protection

2.147. Aircrew ballistic protection includes protection of crewmembers from weapons such as firearm projectiles, fragmentation, shotgun pellets and sharp edges such as knives and spears. This protection is provided through ballistic armour worn by the crewmember. While the Soldier Modernisation SPO (SMSPO) provides guidance on ballistic protection standards, ALSLMU provides guidance specifically relating to the integration of ballistic protection ALSE within Defence aircraft.

2.148. **Design Requirement (Essential).** *If the ballistic protection ALSE design relies upon rapid removal to assist emergency egress, mitigate negative buoyancy in water, or for Helicopter Under Water Escape (HUET), the rapid removal mechanism must be capable of being activated with one hand.*

2.149. **Design Requirement (Essential).** *The material used for the outer layer of a ballistic protection ALSE garment must comply with the ‘Material requirements’ portion of BS EN 1149-5:2008 - Protective clothing - Electrostatic properties Part 5: Material performance and design requirements. Pre-test conditioning of the test specimen must be conducted by cleaning the specimen five times in accordance with the manufacturer’s cleaning instructions.*

Superseded

(a) **Tailoring Advice.** The purpose of this design requirement is to ensure that ballistic protection ALSE does not pose a hazard in an aviation environment due to electrical arcing caused by static electricity. An alternate standard may be used if it can be shown to prevent the ballistic protection ALSE from posing a hazard due to static electricity build up or discharge. ALSLMU advice must be sought prior to use of an alternate standard.

2.150. **Key Considerations.** The following key considerations apply when introducing ballistic protection ALSE:

(a) Ballistic protection ALSE tends to be heavy, affect the posture of the wearer and restrict the mobility of the wearer. It should therefore be considered to be a hazard to the wearer and only be used for the purpose of mitigating hazards which are more severe than the hazard it poses.

(b) Requirements for the level and type of protection of ballistic protection ALSE should be based upon assessment of an identified threat such as a defined set of weapon systems and engagement ranges. Such a threat assessment should also consider any protection offered by an aircraft's structure. Land Division of the Defence Science and Technology Group can be engaged to assist in the conduct of such threat assessments.

(c) Soldier Modernisation Systems Program Office (SMSPO) should be consulted regarding the effectiveness of any proposed ballistic protection ALSE system.

POST EVACUATION SURVIVAL DOMAINS

Survival Aids

2.151. Survival aids are required to support the four priorities of survival; Protection (from environment, enemy, propagation of injuries etc.), Location (signalling equipment, locator beacons, radios etc.), Water and Food. Survival aids can be carried in aircrew or passenger ALSE ensembles, within life rafts or specific survival aid packs carried separately on an aircraft. The type and quantity of survival aids required will depend on the CRE for a particular aircraft and may vary from operation to operation depending upon the potential survival environment and expected recovery times.

2.152. Five survival environments, identified as Sea, Coastal, Arid, Jungle and Extreme Cold, are taught by Combat Survival Training School and addressed in the Professional ADF Aviators Reference Manual (PAARM) Volume 08 Combat Survival. Where necessary, the survival aid requirements are tailored to each of these environments.

2.153. **Limitations.** The following limitations apply to this Survival Aids section:

(a) The requirements of this section may not need to be applied to ADF transport aircraft that operate similarly to an equivalent civil aircraft type. In such cases DASR AMC ORO.70.A 'Compliance Examples' allow the quantity and type of available survival equipment to meet an acceptable civil standard consistent with a similar aircraft type. When not operated similarly to an equivalent civil aircraft type these requirements will need to be applied to ensure survival equipment appropriate to the task or mission is carried.

(b) Life Raft specific equipment such as pumps to inflate rafts, repair kits, patches, bailing buckets, oars/paddles are not considered within this Domain as it is expected that these will be a defined requirement in the design of a life raft and therefore covered in the Life Raft domain.

Superseded

(c) First Aid is only considered within scope of this Domain where it is provided within an ALSE ensemble or Survival Kit for the purposes of use following an aircraft emergency landing, ditching or crash. First Aid kits supplied in an aircraft for use in a medical emergency during flight are considered out of scope.

2.154. National Aviation Authorities prescribe operational requirements for operators to have a means for determining suitable survival aids are selected for their particular operations and related environments. As such an exact and standard set of Survival Aids is not be prescribed here. Instead the types of survival aids that are considered essential and recommended for various environments are identified to allow systems project/program offices to work with operators to determine a tailored solution for a particular platform CRE.

2.155. This may be achieved with a standard survival aid suite that is applicable to all aspects of the CRE with supplemental survival aid configurations identified for particular environments/operations that are added or removed as required.

2.156. The selection and quantity of survival aids should be appropriate for the period of time anticipated between an emergency landing or ditching and the location and provision of support or rescue of survivors.

2.157. Tailoring of the survival aid solution to particular environments/operations and expected rescue time may assist in minimising the size and weight of survival aids.

2.158. The use of multi-functioning equipment may assist with the minimisation of size and weight of survival aids.

2.159. **Design Requirement.** *For each of the five key survival environments the following table identifies the minimum Essential (E) and Recommended (R) survival aids to be available in some capacity on the platform. Items that must be carried on the person (aircrew) are identified with an asterisk (*) others may only need to be in a survival kit or life raft. This table does not identify the exact type or quantity of the survival aid that is required, this must be determined on a case by case basis for a particular platform and the intended type of operation and environment and be suitably justified as part of a safety argument that supports a determination that associated risks have been eliminated or otherwise minimised SFARP. There may be a need for multiple configurations for various operational circumstances.*

Table 2-1: Required Survival Aids

Survival Aid	Sea	Coastal	Jungle	Arid	Extreme Cold
Protection					
First Aid					
Wound Dressings (e.g. bandage, gauze, padding, adhesive tape)	E	E	E	E	E
Tourniquet, Non-pneumatic	E*	E*	E*	E*	E*

Survival Manual (applicable to environment)	E	E	E	E	E
Safety Pins	R	R	R	R	R
Clear Plastic Bags (Transpiration Bags)	R	R	R	R	R
Cord	R	R	R	R	R

Notes:

(a) Dependent on threat environment distress beacons and radios may be either unclassified (for Peace-time Search and Rescue (PSAR)) or encrypted (for Combat Search and Rescue CSAR). Note the current operational solution (PRC-112G) contains both radio and beacon capability along with GPS capability.

(b) IR Glint patch for CSAR applications only

(c) Alternative portable water purification devices may be used however these need to be verified to provide a suitable quality of water.

2.160. **Survival Aid General Requirements and Considerations:** The following General requirements and considerations apply to survival aids.

(a) **Design Requirement (Essential).** *Survival Aids that are prone to damage or degradation by water must be contained in waterproof packaging.*

(b) **Design Requirement (Essential).** *Survival Aids with sharp edges must be packaged to prevent injury to personnel or damage to inflatable ALSE which it is packaged with.*

(c) **Design Requirement (Essential).** *Survival Aids must have a means of preventing loss such as a lanyard connecting them to an ALSE Ensemble, life raft or survival kit as applicable.*

(d) **Design Requirement (Essential).** *Where it is not immediately obvious survival aids must be marked for identification and method of operation.*

(e) **Design Requirement (Essential).** *Survival Aid packaging must be able to be opened with chilled and/or gloved hands. This must be demonstrated by the Chilled Hands and Gloved Hands tests of SAE Aerospace Recommended Practice ARP1282 Rev B Survival Kit, Life Rafts and Slide Rafts.*

Superseded

(f) **Design Requirement (Recommended).** *Metallic survival aid components should be resistant to salt-water corrosion.*

(g) **Key Consideration.** The packaging for Survival Aids needs to be suitably designed to cater for the demands of storage, delivery method and intended use.

(h) **Key Consideration.** Survival Aid documentation should include instructions on the safe use, maintenance and storage of the survival aids. This is particularly important for pyrotechnic devices and bright strobe lights.

(i) **Key Consideration.** When new survival aids are introduced into service, aircrew should be appropriately trained for familiarisation with the equipment and instruction on its' safe use. This is particularly important for pyrotechnic devices, bright strobe lights and the Tourniquet and QuikClot bandage first aid items.

(j) **Guidance Maerial.**

1. Australian Army Land Warfare Procedures – General LWP-G-7-7-6 Environmental Survival identifies general considerations for the development of a survival kit at Chapter 2 paragraphs 2.24 for characteristics of a good survival kit and 2.25 for considerations for optimising the limited space and weight available for survival equipment.

2. In an operational environment it may be necessary to ensure that survival aids are easily concealable.

3. CSTS COMSURV Training identifies the need for carriage of a personal survival kit. ALSE will provide a basic kit. Selection of personal survival kit contents should not duplicate what is provided as ALSE but may supplement it to provide some of the recommended items if they are not able to be accommodated within the ALSE.

2.161. **Integration Requirements and Considerations.** The following Integration requirements and considerations apply.

(a) Survival aids will generally be either carried on the person (aircrew ALSE Ensemble), carried within a life raft or separate survival kit. Some items are critical to the highest priorities of survival and are important to be readily available on the person, the method of carriage will be dependent on the aircraft type, its CRE and the type of operations conducted, and may also be limited by the available space on the platform.

(b) **Design Requirement (Essential).** *Where survival aids are integrated into an ALSE Ensemble, the size and weight of the survival aids must be suitable for accommodation by the ensemble.*

(c) Where survival aids are integrated into an ALSE Ensemble:

1. **Guidance Material.** Tailoring of the survival aid solution to particular environments/ operations and expected rescue time may assist in minimising the size and weight of survival aids.

2. **Guidance Material.** Refer to Carriers and Ensemble Integration domain for further requirements and key considerations related to integration with seat and restraint harness systems, the impact on flight controls movement and compatibility with other aspects of the aircraft cockpit and/or cabin.

Superseded

(d) **Guidance Material.** Where survival aids are integrated into a Survival Kit refer to the Survival Kit and Rescue Pack Domain for further requirements related to the integration into the Survival Kit and to the aircraft.

(e) **Guidance Material.** Where survival aids are stowed in a Survival Kit or life raft, items with limited life or inspection/servicing requirements should be packaged so they are easily accessible for replacement or inspection/servicing.

(f) **Guidance Material.** To limit weight and bulk of survival equipment, duplication across survival aid sources (i.e. carried, survival kit, ditching kit life raft) should be minimised unless deemed necessary for expected survival scenarios.

2.162. **Item Specific Requirements and Considerations.** For a number survival aid types there are some key standards or requirements that must be applied. Where applicable these are prescribed below:

(a) **First Aid**

1. **Guidance Material.** First Aid items should be selected with consideration for injuries that may be sustained from an aviation emergency ditching, landing or crash and the expected survival environment. This should include some combination of bandages, dressings, padding and adhesive tapes. Advice should be sought from Joint Health Command to guide the selection of suitable first aid for a particular application.

(b) **Pyrotechnic Signalling Devices**

1. **Design Requirement (Essential).** *Laser flares must not be used as a substitute for conventional pyrotechnic flares.*

2. **Guidance Material.** Laser flares cannot be considered equivalent to conventional orange smoke flares which provide omnidirectional signalling of location during day conditions. They can be considered as supplemental to pyrotechnic flares only.

3. **Guidance Material.** ALSLMU are not the SME for pyrotechnic signalling devices. For advice contact the Explosive Materiel Branch via casglsdembcoordination@dpe.protected.mil.au group inbox. For safety requirements applicable to pyrotechnic signalling devices refer to the eDEOP101 – Department of Defence Explosives Regulations.

(c) **Light Marker Distress (Strobe Light)**

1. **Design Requirement (Essential).** *Where a light marker distress (Strobe Light) is to be integrated with an ALSE Ensemble its intended position during operation must not be in close proximity to the survivor's eye to ensure the bright light does not impact their vision.*

(d) **Distress Beacons**

1. When interpreting Distress Beacon standards and technology, different terminology can be used to describe the type of distress beacon required. A Personal Locator Beacon (PLB) is generally a small, non-buoyant beacon that is easily carried on the person. An Emergency Position Indicating Radio Beacon (EPIRB) is a buoyant beacon generally used on boats and life rafts and designed to float in the water. Distress beacons are sometimes referred to as Electronic Location Transmitters (ELT), this is generally associated with those fitted to an aircraft however it is also sometimes used

Superseded

to include all types. Care should be taken in the selection of each device as the terminology and intended use can often vary from country to country.

2. **Design Requirement (Essential).** *All beacons used by Defence must be 406.025 MHz COSPAS–SARSAT capable unless approved by HQJOC AOC.*

3. **Design Requirement (Essential).** *Distress Beacons for PSAR applications must comply with the Australian Communications and Media Authority (ACMA) Radio communications (406 MHz Satellite Distress Beacons) Standard 2014 and the referenced requirements of AS/NZS 4280.1: 2017 (for EPIRBs) or AS/NZS 4280.2:2017 (For PLBs).*

4. **Design Requirement (Recommended).** *Distress Beacons for PSAR applications should comply with the remaining aspects of either AS/NZS 4280.1: 2017 (for EPIRBs) or AS/NZS 4280.2:2017 (For PLBs).*

5. **Guidance Material.** FAA TSO-C126a or TSO-C126b approved distress beacons are common. These comply with requirements from RTCA DO-204A or RTCA DO-204B respectively. These standards have not yet been assessed for equivalency with the ACMA standard or AS/NZS standards. As such if a TSO approved beacon is proposed to be used it should be assessed against the essential ACMA standard.

6. **Guidance Material.** TSO-C126 refers to distress beacons as Emergency Locator Transmitters of various types. The applicable types are Survival Class A (Buoyant) which is equivalent to an EPIRB and Survival Class B (Non-Buoyant) which is equivalent to a PLB. Other types relate to those ELTs that are installed to the aircraft itself.

7. **Guidance Material.** Distress Beacons must be registered through Headquarters Joint Operations Command (HQJOC) Air and Space Operations Centre (AOC) on the ADF Search and Rescue Beacon Database.

(e) **Compass**

1. Most compasses are designed to operate in either the Southern or Northern Hemisphere. They do not function correctly in the opposite hemisphere due to an imbalance in the needle from alignment of the earth's magnetic field. As such it is important that a compass is selected suitable for the hemisphere of operation.

2. **Design Requirement (Recommended).** *Where operations span both hemispheres, or aircraft are routinely expected to operate in either hemisphere, a Dual hemisphere compass should be used.*

(f) **Sunscreen**

1. **Design Requirement (Essential).** *Sunscreen provided as a survival aid must be at least SPF 45+ in accordance with AS/NZS 2604:2012 Sunscreen products – Evaluation and Classification.*

(g) **Water**

1. **Design Requirement (Essential).** *Water used in packaged water must meet the requirements of the FSANZ standard 2.6.2 – Non-Alcoholic Beverages and Brewed Soft Drinks.*

Superseded

2. **Design Requirement (Essential).** *Packaged water must meet the requirements FSANZ standard 1.6.1 (Microbiological Requirements for Food). Testing for E.coli should be conducted following the procedure listed in AS/NZS 4276.22.*

3. **Design Requirement (Recommended).** *Once filled, the air above the water level in packaged water should be totally displaced.*

4. **Design Requirement (Recommended).** *Packaged water should have the date of filling stamped after the words Date Filled.*

5. **Design Requirement (Recommended).** *Packaged water should have the batch numbers stamped after the words Bag Batch No.*

6. **Key Consideration.** The packaging for water needs to be suitably designed to cater for the demands of storage, delivery method and intended use for the water. For example water carried in a deployable rescue pack may be carried external to the aircraft cabin and be subject to altitude pressure variations, freezing at low temperatures (noting expansion of water on freezing) and being dropped from altitude.

(h) **Food**

1. **Design Requirement (Essential).** *Food sources provided as survival aids must meet the minimum ADF standard for Combat Rations which is prescribed in DEF(AUST) 10374 Food Safety Standard for Manufacturers and Suppliers of Combat Rations and their Components Standard, Issue 1.*

2. **Guidance Material.** One example of suitable food provisions is the Emergency Flying Ration which is a standardised ration in accordance with DEF(AUST) 10655 that can be included in survival kits or life rafts.

(i) **Knives**

1. **Design Requirement (Recommended).** *The considerations of Australian Army Land Warfare Procedures – General LWP-G-7-7-6 Environmental Survival Chapter 2 Section 2-1 should be applied to the selection of pocket and survival knives as applicable.*

(j) **Electronic equipment**

1. **Design Requirement (Essential).** *Any electronic survival aids must be evaluated for safe carriage and use in accordance with the requirements for portable electronic devices in DASDRM Section 5 Chapter 6 Role Equipment and Portable Electronic Devices (including Annex A). This will ensure safety of the electrical design in an aviation environment (including batteries) as well as for Electromagnetic Interference and Compatibility (EMI/C).*

2. **Key Consideration.** For battery powered devices where spare batteries are provided they should be compatible with the OEM recommended battery type to ensure performance.

(k) **Other.** Requirements for some survival aid items have not yet been developed. Contact ALSLMU for further information and advice on requirements for other items.

Thermal / Immersion Protection

2.163. The main objective of immersion protective clothing is to limit the rate of heat loss of a survivor in water to avoid death from hypothermia before rescue. This objective is achieved by the

Superseded

provision of thermal insulation, generally provided through insulated undergarments, and outer water resistant layers to ensure the insulation continues to perform satisfactorily post submersion in cold water.

2.164. Two major types of immersion suit exist, quick don and constant wear. Both are used in the ADF in order to ensure that all use cases are catered for. Generally, constant wear suits are used in circumstances where there is inadequate space or time to react in an emergency, while quick don suits may be used on larger aircraft where there may be adequate warning prior to a ditching event.

2.165. **Design Requirement (Essential).** *Constant wear immersion suits must comply with ISO 15027-1:2012.*

(a) *Tailoring. The requirements listed at 4.5 relating to conspicuity are deemed non-essential as a less conspicuous suit may be required for operational reasons or to minimise distracting reflections within the flight deck.*

2.166. **Design Requirement (Essential).** *Quick don immersion suits must comply with ISO 15027-2:2012.*

(a) **Tailoring.** The requirements listed at 4.5 relating to conspicuity are deemed non-essential as a less conspicuous suit may be required for operational reasons or to minimise distracting reflections within the flight deck

2.167. Design Requirement (Essential). All immersion suits must be tested to ISO 15027-3:2012.

(b) **Guidance Material.** The standard gender breakdown for testing assumes 6 personnel of which at least one but no more than three are female. It is recommended that testing be conducted with an equal gender balance where possible.

2.168. **Design Requirement (Recommended).** *Quick don immersion suits should also comply with the illumination resistance requirements outlined at 4.12.2 of ISO 15027-1:2012.*

(a) **Guidance Material.** Properly stored quick don immersion suits are not expected to be significantly exposed to light, but it is possible that some may become exposed therefore some resistance to degradation is desired.

2.169. **Design Requirement (Recommended).** *Immersion suits should have an attached sprayhood as per ETSO-2C502 requirement 10 – breathing protection.*

(a) **Guidance Material.** A spray hood can minimise the risk of secondary drowning in rough water. Should a spray hood be impractical other means of limiting secondary drowning should be implemented.

2.170. **Key Considerations.** The following key considerations should be taken into account when introducing immersion suits to service.

(a) There exists several classes of immersion suit, each rated for varied temperatures and durations of immersion. It is important the appropriate class of immersion suit is selected based in the water temperature, likely response time in an emergency and the ambient air temperature. A solution with excessive insulation may lead to heat related injury, insufficient insulation may lead to hypothermia.

(b) Integration of Immersion suits with other ALSE and confined cockpits must be completed to ensure that the immersion suit does not significantly impede the wearer or their equipment

Superseded

2.171. Survival Kits and Rescue Packs provide a means of holding a range of survival aids for use either following an aircraft emergency or for delivery to survivors as part of a Search and Rescue operation. Guidance relating to the internal contents (life rafts and survival aids) of survival kits and rescue packs can be found separately in the domain in which they belong.

2.172. Survival Kits and Rescue Packs are categorised by the following definitions:

(a) **Survival Kit.** A kit installed or carried on to an aircraft containing survival aids to assist crew and passengers in the event of an emergency landing, ditching or crash.

(b) **Rescue Pack.** An air droppable pack designed to provide assistance to survivors on the land or at sea. This may include survival aids, first aid, medical or other equipment and life rafts as required by the intended application.

2.173. **Design Requirement (Essential).** *When fitted to an aircraft survival kits must be stored in a marked location that is rapidly accessible and does not hinder evacuation.*

2.174. **Design Requirement (Essential).** *Survival kits must meet the fire resistance requirements of Part I of Appendix F to FAR 25 as applicable.*

2.175. **Design Requirement (Essential).** *Battery operated equipment must have sufficient battery capacity available to allow for operation throughout the intended survival duration of the survival kit or rescue pack in which the equipment is contained.*

(a) **Key Consideration.** This requirement may be met though a single large capacity battery, multiple interchangeable batteries or a means to reliably recharge the battery in the field.

2.176. **Design Requirement (Recommended).** *The battery charge at which battery operated equipment will cease to function correctly should be established.*

2.177. **Design Requirement (Recommended).** *Rescue Packs should meet the fire resistance requirements of part I of Appendix F to FAR 25 as applicable.*

2.178. **Design Requirement (Recommended).** *Battery expiration dates of included equipment should be marked on the exterior of a survival kit or rescue pack.*

2.179. **Design Requirement (Recommended).** *Survival kits and rescue packs should be designed in a manner such that the probability of any error in configuration of its contents is limited.*

2.180. **Design Requirement (Recommended).** *Survival Kits and Rescue packs should not become damaged in a manner that reduces its function by temperature cycles, pressure cycles, forces or exposure to other environmental conditions placed upon it both during flight and when not in use but fitted to the aircraft on the ground.*

2.181. **Key Considerations.** In addition to the standards and requirements identified the following key considerations should be taken into account in the design of Survival Kits and Rescue Packs.

(a) Components of Survival Kits and Rescue Packs should be generally resistant to wear and tear.

(b) Weight and balance of the rescue pack should be understood and suitably communicated to operators.

(c) Survival Kits and Rescue Packs should be packed in such a manner to minimise the likelihood of damaging survival aids.

Superseded

(d) Further guidance and test methods are contained in MIL-HDBK-1763 Aircraft Stores Compatibility.

(e) AMTDU's Aerial Delivery Development personnel are the SME's and certifier for load clearance and should be contacted for advice on how to attain and maintain load clearances.

Continuing Airworthiness Requirements

2.182. To ensure that Survival Kit and Rescue Pack functions are not compromised through inadequate continuing airworthiness management systems, the following continuing airworthiness requirements and key considerations apply.

2.183. **Continuing Airworthiness Requirement (Essential).** *All components of Survival Kits and Rescue Packs must be regularly inspected and maintained in accordance with approved Instructions for Continuing Airworthiness. This includes ensuring that batteries are inspected, charged and replaced as required.*

2.184. **Continuing Airworthiness Requirement (Essential).** *Life Support equipment must be inspected, repaired and packed in an approved maintenance facility IAW AAP 7220.001-99 Aeronautical Life Support Instructions.*

2.185. **Continuing Airworthiness Requirement (Essential).** *Crew and maintainers must be trained in the correct procedures for manual handling for the purposes of loading and deploying Survival Kits and Rescue Packs.*

2.186. **Continuing Airworthiness Requirement (Recommended).** *Battery operated equipment should have batteries replaced or recharged once the charge drops below the minimum required for correct functioning.*

RESPIRATION DOMAINS

Oxygen / Smoke and Fumes Masks

2.187. DASDRM Section 3 Chapter 6 includes requirements for Aircraft Oxygen Systems. Some of the requirements of that chapter may be considered applicable to oxygen masks as a subset of the oxygen system and should therefore also be considered in addition to the requirements of this section.

2.188. **Design Requirement (Essential).** *Materials used in oxygen / smoke and fumes masks must be assessed as suitably fire resistant, at the intended temperature ranges, and oxygen concentration levels to which the mask will be exposed by applying relevant materials standards and requirements prescribed within S3C6.*

2.189. **Ejection Seat Aircraft.** For ejection seat aircraft the following requirements must be applied for oxygen / smoke and fumes masks.

(a) **Design Requirement (Essential).** *The requirements of Air Force Interoperability Council Air Standard ASM 4068 – Physiological Requirements for Aircrew Oxygen Masks for Use at High Breathing Pressures Ed2 v2.*

(b) **Design Requirement (Essential).** *The mask related requirements in Air Force Space Interoperability Council Air Standard ASMG 4039 – Minimum Physiological Requirements for Aircrew Demand Breathing Systems Ed1 v2.*

Superseded

(c) **Design Requirement (Essential).** *Inwards relief features, such as an anti-suffocation valve, must be incorporated into oxygen / smoke and fumes masks unless it can be demonstrated that a failure of the breathing air system, that induces suffocation, meets the associated failure probability objective for a catastrophic failure condition. Analysis is one way of demonstrating this compliance.*

2.190. **Non-Ejection Aircraft.** For Non-Ejection aircraft the following requirements apply:

(a) **Design Requirement (Essential).** *For aircraft with type certification based on civilian airworthiness codes the following civilian based requirements of oxygen and smoke and fumes masks must be applied:*

1. *Pilot/Co-Pilot/Other Sedentary Aircrew masks must be of the Quick-Don type and meet the requirements of:*

   i. *TSO-C99a Flight Deck (Sedentary) Crewmember Protective Breathing Equipment, of 05 Jun 08, or*

   ii. *ETSO-C99a Flight Deck (Sedentary) Crewmember Protective Breathing Equipment, of 05 Aug 16.*

2. *Mobile Aircrew masks must meet the requirements of:*

   i. *TSO-C116a Crewmember Portable Protective Breathing Equipment, of 30 Jul 09,or*

   ii. *ETSO-C116a Crewmember Portable Protective Breathing Equipment, of 05 Aug 16.*

3. *Passengers masks must meet the requirements of:*

   i. *TSO-C64b Federal Aviation Administration Technical Standard Order: Passenger Oxygen Mask Assembly, Continuous Flow, of 21 May 08, or*

   ii. *ETSO-C64b European Technical Standard Order: Oxygen Mask Assembly, Continuous Flow, Passenger, of 19 Dec 16.*

4. *Demand Oxygen Masks must meet the requirements of:*

   i. *TSO-C78a Crewmember Demand Oxygen Masks, of 27 May 08, or*

   ii. *ETSO-C78a Crewmember Demand Oxygen Masks, of 21 Feb 18.*

5. **Tailoring Advice.** The standards referenced by the TSO documents prescribe particular microphone standards. In the event that the microphone standards are not suitable for integration with the aircraft then alternative microphones may be permitted. In such cases it must be shown that the microphones are safe to operate in the oxygen rich environment with an equivalent level of safety.

6. **Key Consideration.** Oxygen Masks designed under the prescribed Ejection Seat Aircraft requirements can be utilized in Non-Ejection aircraft if the design is deemed suitable to the CRE.

(b) **Design Requirement (Essential).** *For other ADF aircraft the requirements identified above for civil based aircraft at sub-para a must be applied with the following additional considerations:*

Superseded

1. *Use during periods of intended cabin depressurisation, not just for emergency, must be accounted for. This includes the need to allow the wearer to occlude their nostrils in order to perform the Frenzel and/or Valsalva manoeuvre whilst wearing the mask.*

2. *Operating altitude / cabin altitude requirements for defence aircraft may exceed the requirements of the prescribed standards. In such cases the relevant standard must be tailored to cater for the higher altitudes of a specific aircraft's CRE.*

3. *In some aircraft CRE, passengers may require additional smoke and fumes protection of the eyes. In these cases TSO-C64b / ETSO-C64b will not be suitable. SAE AS8048 Performance Standard for Passenger Smoke and Toxic Fumes Respiratory Protective Equipment or standards for aircrew protective breathing equipment must be applied for passenger applications where protection of the eyes from smoke and fumes is required.*

(c) Where only smoke and fumes protection is required (for example on aircraft operating below the altitudes at which supplementary oxygen is required such as rotary wing aircraft) the following standard may be applied:

1. **Design Requirement (Recommended).** Air Force Interoperability Council Air Standard ASM 4066 Ed 1v4 Smoke Protection Breathing Equipment Used by Mobile Aircrew in Non-Ejection Seat Aircraft at Pressure Altitudes up to 10,000ft.

2. **Design Requirement (Recommended).** In addition to ASM 4066 Ed 1v4 requirements the mask should allow the wearer to occlude their nostrils in order to perform the Frenzel and/or Valsalva manoeuvre whilst wearing the mask.

(d) **Design Requirement (Recommended)** Inwards relief features, such as an anti-suffocation valve, should be incorporated into oxygen / smoke and fumes masks unless analysis demonstrates that a failure of the breathing air system, that induces suffocation, meets the associated failure probability objective for a catastrophic failure condition.

2.191. **Key Considerations**. In addition to the standards and requirements identified the following key considerations should be taken into account in the design of an Oxygen / Smoke and Fumes mask:

(a) Materials should not contaminate breathing gases so as not to irritate the respiratory system or pose long term safety hazards.

(b) Parts of the mask which come into contact with the skin of the head and neck should be made of soft, pliable materials which are non-irritating, non-allergenic, and non-toxic to wet and dry skin.

(c) Masks should not impart an offensive smell or taste to the wearer.

Underwater Emergency Breathing

2.192. Underwater Emergency Breathing Devices (UEBD) consist of a means of storing pressurised air and a regulated delivery system. UEBD are designed for use in rotary wing aircraft to extend the available escape duration should it be rapidly sinking.

2.193. **Design Requirement (Essential).** *The UEBD must meet all requirements of ACS 4043 of 27 Feb 02.*

Superseded

2.194. **Design Requirement (Essential).** *The UEBD must meet the following requirements from UK CAA draft technical standard CAP 1034 "Development of a Technical Standard for Emergency Breathing Systems" of May 2013.*

(a) *Be simple to deploy and capable of being operated with either hand. The number of deployment actions must be minimised, ideally, with no more than one action being required to activate the system on submersion.*

(b) *Potential snagging hazards must be reduced to a minimum. Any part of the UEBD that might pose a snagging hazard during flight, emergency evacuation, escape or must be suitably covered, protected or restrained.The UEBD design and materials used in its construction must be chosen to have no features which would have a detrimental effect on the performance or operation of other equipment, impair the performance of the seat harness or hinder harness release. UEBD must not impede or prevent escape from a submerged helicopter.*

2.195. **Design Requirement (Essential).** *Requirements 5.7.1 a to f of EN 250:2014 relating to demand regulator performance; work of breathing and respiratory pressure must be met in order to maximise ease of breathing and to minimise the risk of barotrauma.*

2.196. **Design Requirement (Essential).** *Pressure cylinders must meet the requirements of AS 2030.1-2009.*

2.197. **Design Requirement (Recommended).** *The mouthpiece, with the hose and general assembly should withstand a minimum of 1000N as per BS EN 250:2014 requirement 5.8.1 relating to external force on the hose assembly.*

2.198. **Design Requirement (Recommended).** *Head movement should not have any negative effects on the air supply pressure or volume at the mouthpiece.*

2.199. **Key considerations.** The following are key considerations that should be considered when introducing underwater emergency breathing devices.

(a) UEBDs are designed to assist with proven existing egress procedures, they are not the only consideration in helicopter underwater escape.

(b) The intent of a UEBD is not as a SCUBA device, UEBD is intended for escape only, users should not attempt to re-enter the aircraft once they have successfully egressed.

(c) Extensive HUET training is required for all users of UEBD, regular training in proper use of the system is required in order to extract maximum benefit from the system should it be required in an emergency.

(d) Breathing air that meets the minimum standards prescribed at paragraph 4.4.2 of AS/NZS 2299.1:2015 should be used to fill the cylinder.

Table 2-2: Breathing air gas composition per 4.4.2 AS/NZS 2299.1:2015

Component	Concentration at 15°C and 101.3 kPa
Oxygen	(21 ±1)% by volume
Carbon Dioxide	≤600 ppm (≤1500mg/m^3)

Superseded

Carbon Monoxide	≤5 ppm (≤8mg/m^3)
Oil	≤0.5 mg/m^3
Odour	No objectionable odour

(e) The available quantity of breathing air should be maximised while maintaining a form factor with minimal impacts on other ALSE and mobility. For example a 4500psi system is preferred over a comparable 3000psi system.

(f) Integration of UEBDs with clothing should consider the placement of all other equipment. The best overall solution which ensures that the UEBD is readily accessible while providing minimal impact on other equipment should be sought. Placement of the UEBD should also consider the forces of a crash and the potential for injury.

(g) As with any high pressure vessel, dangerous goods considerations are required when transporting UEBDs. This is managed through existing procedures for managing dangerous goods relating to scuba tanks.

(h) Filling procedures should be compliant with AS 2030.5-2009.

(i) Moisture content should be minimised and ideally be less than 100mg/m3 as recommended in AS/NZS 2299.1:2015 paragraph 4.2.4.

SENSORY PROTECTION DOMAINS

Hearing Protection

2.200. Noise is a workplace hazard regulated by the WHS Regulations 2011 at Chapter 4, Part 4.1. Regulations 56, 57, 58 and 59. Importantly Regulation 56 defines the exposure standard for noise.

2.201. ADF policy is presented in SafetyMan Noise Management Procedure 04 – Noise Identification Assessment and Monitoring, which identifies that specialist advice is available to support noise assessments.

2.202. CASsafe Requirements for Managing Regulated Hazards, Regulated Hazard 2 - Noise provides relevant CASG policy and identifies that specialist advice is also available from the CASG directorate of Work Health and Safety.

2.203. Hearing protection includes both passive and Active Noise Reduction (ANR) and in some cases includes helmet design as a major contributing design factor. The aircraft platform cockpit and cabin noise profile is required when determining the type of hearing protection necessary. Different hearing protection configurations may be required for each individual aircraft platform. Alternate configurations may also be required to satisfy comfort requirements of individual aircrew and passengers.

2.204. Aircrew hearing protection generally needs to cater for communications and situational awareness of aircraft noises and warning signals. In many cases, Aircrew hearing protection will need to be integrated with a flight helmet. In some cases, passengers may need similar hearing protection solutions to aircrew, in others general Personal Protective Equipment (PPE) type hearing protection

Superseded

may be suitable. Regardless, the process of assessing noise hazards for passengers requires the same level of rigour as for aircrew to ensure adequate protection is provided.

IMPORTANT NOTE

The focus of this section is the identification of standards and requirements for hearing protection equipment selection. Selection of hearing protection lies within the identification of risk control measures phase of a risk assessment process and is considered PPE, the lowest level of control in the hierarchy of controls. Selection of hearing protection can only occur once the sources of noise are identified, the risks associated with the noise are assessed and understood (i.e. noise levels are measured) and the higher controls of elimination, substitution, engineering and administration have been considered and applied where reasonably practicable.

2.205. **Key Considerations.** for this process are provided along with the prescription of standards and requirements for hearing protection due to the importance of first understanding the noise hazard and managing it with a wider application of the hierarchy of controls.

Understanding Noise Hazards

2.206. **Key Consideration.** The Work Health and Safety (WHS) (Managing Noise and Preventing Hearing Loss at Work) Code of Practice 2015 should be applied to the assessment of aircraft noise hazards. (This is an approved code of practice under section 274 of the WHS A) AS/NZS 1269.0:2005(R2016) Occupational Noise Management - Part 0: Overview and General Requirements also provides guidance on adopting an integrated approach to noise management and outlines how the AS/NZS 1269 series of standards can be applied.

2.207. **Key Consideration.** The first phase of managing noise is identifying the noise hazards and assessing the risk. This can be achieved by conducting noise surveys to measure and understand the noise aircrew and passengers on aircraft are exposed to. This should include consideration of pre and post-flight noise of the airfield that is routinely encountered. AS/NZS 1269.1:2005 (R2016) Occupational Noise Management – Measurement and Assessment of Noise Immission and Exposure provides suitable requirements and guidance on the types of noise assessment that may be required, the general objectives of an assessment and the instrumentation and procedures needed to carry it out. Of particular interest is Section 6.3 identifying noise assessments required for hearing protector programs and Section 8.5 detailing the measurement procedures required for selecting hearing protectors. Within Defence the following support is available:

(a) The Institute of Aviation Medicine (IAM) may be engaged to support the conduct of noise surveys for ADF aircraft.

(b) Environmental Health Officers (ENVHOs) may be engaged to support the conduct of noise assessments.

(c) CASG Directorate of Work Health and Safety may provide Occupational Medicine and Hygiene specialist advice.

2.208. **Key Consideration.** Once the noise risks are understood, WHS Regulations require them to be eliminated or otherwise minimised SFARP using the hierarchy of controls. AS/NZS 1269.2:2005(R2016) – Occupational Noise Management Part 2 Noise Control Management provides requirements and guidance on the management of noise controls and may be a useful reference for the consideration of higher order risk controls before applying hearing protection as PPE.

Superseded

2.209. **Key Consideration.** All considerations of Section 5.6 of the WHS (Managing Noise and Preventing Hearing Loss at Work) Code of Practice 2015 are applicable to the selection of hearing protectors.

Hearing Protector Selection Requirements

2.210. **Design Requirement (Essential).** *Where higher order risk controls cannot reduce noise exposure below the exposure standard (LAeq,8h of 85 dB(A), or LC peak of 140 dB(C), WHS Regulation 56) hearing protection solutions must be selected in accordance with AS/NZS 1269.3:2005 (R2016) Occupational Noise Management – Hearing Protector Program Section 6 and appendices A and B. The following ADF policy in SafetyMan must be applied:*

(a) *Both the Classification Method and then Octave-Band Method must be applied for all Red, Black and Extreme hearing protection zones (i.e. continuous noise levels exceed 100 dB(A)).*

(b) *For Earplugs and Earmuffs worn in combination for use in Black and Extreme hearing protection zones (i.e. continuous noise levels exceeding 115 dB(A)) the combined attenuation is calculated by adding 3 dB to the highest noise reduction level of the two personal hearing protectors. This must be considered as information from the relevant authority for the purposes of AS/NZS 1269.3:2005 (R2016) paragraph 6.2.5. At lower noise levels, manufacturer information on combined attenuation is to be used.*

2.211. **Design Requirement (Recommended).** The exposure standard applied for the selection of hearing protection should be reduced (from the regulated LAeq,8h of 85 dB(A) or LC,peak of 140 dB(C)) to an LAeq,8h of 80 dB(A) or LC,peak of 135dB(C) to account for the potential exposure of aircrew to ototoxic chemicals present in aviation fuel as recommended in the WHS (Managing Noise and Preventing Hearing Loss at Work) Code of Practice 2015 and SafetyMan Noise Management Procedure 04.

2.212. **Design Requirement (Recommended).** *The exposure standard applied for the selection of hearing protection should be reduced (from the regulated LAeq,8h of 85 dB(A) or LC,peak of 140 dB(C)) to an LAeq,8h of 80 dB(A) or LC,peak of 135dB(C) for children. For the purpose of this requirement a 'child' is a person under the age of 17, who is too physically small to be fitted with hearing protection which would otherwise be available for use by adults.*

2.213. **Design Requirement (Recommended).** *Efforts should be made to reduce noise exposure below the exposure standard SFARP, cognisant of the following (where applicable):*

(a) Where routine work that requires speed or attentiveness, or where it is important to carry on conversations, the exposure should be kept to LAeq,8h of 70 dB(A) as identified by the WHS (Managing Noise and Preventing Hearing Loss at Work) Code of Practice 2015.

(b) Where sortie durations exceed 10 hours, exposure should be adjusted to account for increased risk of hearing loss in accordance with WHS (Managing Noise and Preventing Hearing Loss at Work) Code of Practice 2015 and SafetyMan Noise Management Procedure 04.

(c) Where aircrew fly more than 5 days a week or more than 8 hours per day, exposure standards should be adjusted as described in SafetyMan Noise Management Procedure 04.

Hearing Protector Design and Performance Requirements

2.214. **Design Requirement (Essential).** *Hearing protectors must comply with the requirements of AS/NZS 1270:2002 (R2014) Acoustics - Hearing Protectors, tailored as follows:*

Superseded

(a) *The majority of requirements and testing are designed for conventional hearing protectors such as Ear Muffs and Ear Plugs and may not be directly applicable to hearing protection solutions required for aircrew and passengers (e.g. those integrated with aircrew helmets). The contribution of the helmet to attenuation of sound should be considered as part of the hearing protection solution. Such solutions should be considered 'Other Devices' as identified at Section 5, and the clauses for complying with Section 2 general requirements as far as possible and applying testing of Sections 3 and 4 in a way that meaningful comparisons can be made with more conventional hearing protectors, should be applied as in the following examples:*

1. *The low temperature drop test for helmet-mounted earmuffs should not be applied to aircrew helmets where the hearing protectors are contained within the helmet and are unlikely to be damaged by situations that this test represents.*

2. *Aircrew helmets usually achieve fitment of the hearing protector to the ear by custom fitting of the helmet. As such, headband-flexing test would not be applicable. In such cases, an analytical assessment of the hearing protection elements of the helmet to ensure sufficient retention and sealing around the wearers ear can be achieved by the means of fitting and adjustment provided with the helmet.*

(b) *ANR Hearing Protectors are considered 'Specialist Devices' in accordance with clause 1.4.12 and should be treated in accordance with Section 5. Further consideration of ANR and other applicable requirements is provided in a dedicated section below.*

(c) *Hearing protection solutions may be assessed/tested to international standards. To cater for these solutions this requirement may, where not deemed reasonably practicable to have the solution tested to this AS/NZS 1270:2002(R2014), be met by suitable analysis to determine that the international standard provides an equivalent level of attenuation.*

Active Noise Reduction Requirements

2.215. ANR technology provides improved attenuation at low frequencies (up to 1000 Hz) and negligible attenuation (and in some cases slightly negative attenuation) at higher frequencies (above 1000 Hz). Any selection of ANR will require detailed understanding of the platform noise profile and the specific performance details of the ANR technology being considered to ensure it provides suitable noise attenuation and its effect on intelligibility of communications is understood. When ANR hearing protection is to be used, the following requirements and considerations apply:

(a) **Key Consideration.** ANR hearing protectors are considered 'Specialist Devices' and should be tested as passive devices in accordance with AS/NZS 1270:2002(R2014), as identified above, for the purposes of a baseline comparison to conventional protectors. This will also provide an assessment of the minimum protection afforded in the event of ANR failure.

(b) **Design Requirement (Recommended).** *Active noise reduction systems used in helmets and headsets should be evaluated in accordance with Advisory Publication (ADV PUB) ASMG 4092 Ed 1 (v1, v2 or v3) – The Evaluation of Active Noise Reduction (ANR) in Flight Helmets and Headsets with the following considerations:*

1. *The Measurement of Sound Pressure Levels at the Ear Canal method should be used as the preferred laboratory method noting it is suitable for ear cup type protectors.*

2. *Other laboratory methods presented in ADV PUB ASMG 4092 Ed 1 (v1, v2 or v3) for assessing attenuation should be considered for the evaluation of in-ear ANR devices where the measurement by microphone is not possible.*

Superseded

3. *The laboratory method for assessing signal detection presented in ADV PUB ASMG 4092 Ed 1 (v1, v2 or v3) should be used.*

4. *The subjective Modified Rhyme Test method presented in ADV PUB ASMG 4092 Ed 1 (v1, v2 or v3) should be used to assess speech intelligibility.*

5. *The field assessment of attenuation inflight by measuring the Ear Canal sound pressures by microphone and comparing with measurements outside of the helmet/ headset should also be used noting this is limited to assessment of ear cup type protectors. Where used in combination with earplugs or for in-ear ANR systems, additional assessment is required. Subjective assessment via questionnaire is also identified and considered suitable to form part of an evaluation of ANR systems.*

6. *The method of field assessment for improvement in signal detection by introducing tones through the ICS during flight/operating profiles and comparing the volume settings required with ANR OFF and ON to provide a measure of improved signal detection should be applied.*

7. *Subjective Field Speech intelligibility assessment methods should be used to evaluate ANR improvements in speech intelligibly.*

(c) Some international standards for Active Noise Reduction have been identified by ALSLMU but are yet to be fully considered. Contact ALSLMU to discuss ANR requirements.

General requirements and considerations for hearing protection solutions

2.216. **Design Requirement (Essential).** *Aircraft warning tones and annunciations must remain audible to aircrew whilst wearing the hearing protection.*

2.217. **Design Requirement (Essential).** *Speech communications over radio and intercommunications systems must remain audible and intelligible to aircrew whilst wearing the hearing protection.*

2.218. **Key Consideration.** The effect of hearing protection on direct voice communications should be evaluated where required. The safety of personnel will need to be prioritised to ensure exposure standards are not exceeded. This may necessitate additional communications equipment where such communication is deemed essential and cannot be achieved directly with necessary hearing protection in place.

2.219. **Design Requirement (Essential).** *Where rapid altitude pressure changes are possible (e.g. fast jet applications) hearing protectors that effectively seal the ear canal must allow for equalisation of pressure across the protector between the inner ear and surrounding environment to prevent ear damage. E.g. when an individually moulded Communication Earplug (CEP) is used a vented CEP transducer is required.*

2.220. **Key Considerations.** Hearing protection to be used with aviation helmets should not adversely impact other requirements of the helmet, particularly the provision of impact, penetration and/or ballistic protection. This is especially important when fitting new hearing protection to an existing helmet, and less so when being considered as an integrated part of the helmet design. The following should be considered as applicable:

(a) When fitting new hearing protection to an existing helmet the impact on the compliance of a helmet to its specification should be assessed.

Superseded

(b) When implementing a new integrated helmet and hearing protection solution the impact of the hearing protection elements on the requirements prescribed for the Helmet Domain in this chapter of the DASDRM should be considered.

2.221. Key Consideration. Where moulded Earplug or CEP are used the application of lubricant can achieve increased attenuation along with improved ease of insertion and comfort. If lubricant is required to achieve improved attenuation, assessment should consider whether the lubricant will persist in the ear for the duration of noise exposure.

2.222. **Key Consideration.** Where hearing protection solutions allow use of ancillary connected devices (such as Bluetooth connected mobile phones and media players) the sound levels of ancillary audio media play back will contribute to the noise exposure and will need to be considered in noise assessments. Guidance on appropriate use of ancillary devices and the contribution to noise levels should be provided in associated Orders, Instructions and Procedures (OIP).

Related considerations

2.223. When introducing hearing protection solutions the following related key considerations apply:

(a) **Key Consideration.** Hearing protectors should be adequately managed and supported by a hearing protector program to ensure their full effectiveness is achieved. AS/NZS 1269.3:2005 (R2016) Occupational Noise Management Part 3 Hearing Protector Program Section 4 identifies necessary Management Responsibilities whilst Sections 7 through 13 provide guidance that will support the development of a robust program that supports issue, fitting, cleaning, maintenance, training and effective use of hearing protectors.

(b) **Key Consideration.** When providing hearing protection solutions the provision of suitable instructions and training in the OEM's recommended use of the protection to users is essential. The level of protection provided can be significantly reduced if not used correctly for the entire duration of noise exposure, leading to hearing loss or tinnitus. This is particularly important for foam earplug type protection which can provide little to none of the intended attenuation if not inserted correctly. SafetyMan Noise Management Procedure 07 Education, Training and Instruction provides ADF policy on Noise training and provision of promulgation of instructions in OIP.

(c) **Key Consideration.** The WHS (Managing Noise and Preventing Hearing Loss at Work) Code of Practice 2015 and SafetyMan Noise Management Procedure 04 provides guidance on the ongoing monitoring of noise hazards and reviewing control.

(d) **Key Consideration.** Whilst the purpose of hearing protection ALSE is to eliminate or reduce the exposure of personnel to aircraft noise, crew being able to hear the operation of aircraft systems contributes to situational awareness. Crew being able to hear the functioning or malfunctioning or aircraft systems at moderate sound levels through hearing protection is considered desirable.

Night Vision Systems

2.224. Aviation Night Vision Imaging Systems (ANVIS) are helmet mounted goggle assemblies that provide aircrew with night vision capabilities to support the conduct of flying operations at night. The goggles come in a binocular configuration and are powered by battery. There are currently two types of ANVIS goggles approved for Defence use: the AN/AVS-6 and AN/AVS-9. Within these types, there are different configurations that relate to the type of objective lens and type of Image Intensifier Tube (IIT). RTCA DO-275 contains the minimum operational performance standards (MOPS) for aviation night vision imaging systems (NVIS).

Superseded

2.225. **Design Requirement (Essential).** *NVG technologies must comply with STANAG-7042 ED.2 Image Intensifying Night Vision Devices for Aircraft.*

2.226. **Key Considerations.** When introducing new NVG technologies or modifying extant configurations the following considerations apply:

(a) Institute of Aviation Medicine (IAM) should be engaged to assess physiological effects of significant changes to NVG technologies, such as change in phosphor colour (white vs green) or large changes in performance levels compared with in service NVGs.

(b) Ground based assessment of NVGs should be made prior to progressing to flight testing. (Defence Science and Technology Group have NVG test facilities available).

(c) NVGs should be assessed for compatibility with Aircraft Lighting (additional information and standards for Aircraft Lighting and Night Vision Imaging Systems can be found in Section 3 Chapter 7).

(d) NVGs should be assessed for compatibility with Aircraft Head Up Display (HUD) systems where applicable.

(e) NVGs should be assessed for compatibility with aerodrome lighting and obstacle lighting, Noting there are known issues with LED based obstacle lighting not being visible through NVGs, the risk associated with any non-compatibility should be identified and eliminated or otherwise minimised SFARP.

CBRN Protection

2.227. CBRN protection ALSE consists of body covering garments, masks, and equipment to supply uncontaminated breathing air. The body covering garments can be worn under, over, or in lieu of other ALSE or flying clothing. Masks can be half face oronasal types, or full face masks which can also be incorporated in a hood.

2.228. **Design Requirement (Essential).** *An assessment of the effectiveness of a CBRN ALSE countermeasure in a CBRN threat environment for which it is intended to be used must be conducted in consultation with applicable subject matter experts.*

(a) **Guidance Material.** Subject matter experts should belong to the Department of Defence, or be otherwise endorsed by applicable agencies in the Department of Defence. As an example the Chemical Biological Defence Branch of the Defence Science and Technology Group would be suitable for consultation regarding chemical or biological threat environments.

2.229. **Design Requirement (Essential).** *Any part of CBRN ALSE which covers the face must facilitate one handed doffing.*

2.230. **Design Requirements (Essential).** *CBRN ALSE must facilitate the wearer drinking without compromising CBRN protection.*

2.231. **Design Requirement (Essential).** *CBRN ALSE must protect the wearer from hypoxia as per paragraph 4c of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.232. **Design Requirement (Essential).** *A CBRN ALSE mask must allow the wearer to eliminate mucus and vomitus from the mask as per paragraph 4i of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

Superseded

2.233. **Design Requirement (Essential).** *CBRN ALSE must facilitate donning and doffing contaminated CRBN ALSE as per paragraph 9 of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.234. **Design Requirement (Essential).** *CBRN ALSE which incorporates an oronasal mask must seal per paragraph 12a of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.235. **Design Requirement (Essential).** *A CBRN ALSE mask must facilitate the equalisation of inner ear pressure as per paragraph 13 of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.236. **Design Requirement (Essential).** *A CBRN ALSE mask which incorporates optical transparencies must incorporate anti-mist/anti-fogging features as per paragraph 17 of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.237. **Design Requirement (Essential).** *If CBRN ALSE displaces eye and face protection ALSE, the CBRN ALSE must be assessed for suitability as eye and face protection as per the eye and face protection domain portion of this chapter.*

2.238. **Design Requirement (Essential).** *The material used for any item of CBRN ALSE which is worn as the outer layer of clothing must comply with the 'Material requirements' portion of BS EN 1149-5:2008 - Protective clothing - Electrostatic properties Part 5: Material performance and design requirements. Pre-test conditioning of the test specimen by laundering is not required.*

(a) **Tailoring Advice.** The purpose of this design requirement it to ensure that CBRN ALSE does not pose a hazard in an aviation environment due to electrical arcing caused by static electricity. An alternate standard may be used if it can be shown to prevent the CBRN ALSE from posing a hazard due to static electricity build up or discharge.

2.239. **Design Requirement (Essential).** *The material making up the outer layer of CBRN ALSE which is worn as the outer layer of clothing must be subject to Test Procedure A – Surface Ignition of ISO 15025:2016. Pre-test conditioning of the test specimen by laundering is not required. Adherence to the following criteria must be assessed for a material or garment passing this test:*

(a) *No specimen shall give flaming to the top or either side edge.*

(b) *No specimen shall give hole formation.*

(c) *No specimen shall give molten or flaming debris.*

(d) *The mean value of the after flame time shall be equal to or less than 2 seconds.*

(e) *The mean value of the afterglow time shall be equal to or less than 2 seconds.*

2.240. **Design Requirement (Essential).** *The material making up the outer layer of CBRN ALSE which is worn as the outer layer of clothing must be subject to Test Procedure B – Bottom Edge Ignition of ISO 15025:2016. Pre-test conditioning of the test specimen by laundering is not required. Adherence to the following criteria must be assessed for a material or garment passing this test:*

(a) *No specimen shall give flaming to the top or either side edge.*

(b) *No specimen shall give hole formation.*

(c) *No specimen shall give molten or flaming debris.*

(d) *The mean value of the after flame time shall be equal to or less than 2 seconds.*

Superseded

(e) *The mean value of the afterglow time shall be equal to or less than 2 seconds.*

2.241. **Design Requirement (Essential).** *The weight, size and materials of a CBRN ALSE mask must comply with paragraph 8 of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.242. **Design Requirement (Essential).** *Integration of CBRN ALSE must be conducted in accordance with the instructions contained in Air and Space Interoperability Council - ADV PUB ASM 4084 Methodology for Integration Testing of Aircrew Clothing and Equipment.*

(a) **Tailoring Advice.** ADV PUB ASM 4084 uses non proscriptive language such as 'should' rather than terms such as 'must' or 'shall'. This design requirement mandates that all portions of ADV PUB ASM 4084 must be considered, but compliance findings of 'not applicable' can be assessed as acceptable.

2.243. **Design Requirement (Essential).** *CBRN ALSE must facilitate the elimination of bodily waste.*

(a) **Tailoring Advice.** CBRN ALSE intended for short term wear must facilitate urination. Failing to do so is likely to result in wearers self-restricting fluid intake which could lead to dehydration. CBRN ALSE intended for longer term wear must accommodate defecation and the management of menstrual blood flow.

(b) **Guidance Material.** Management of diet and use of medication, both under the supervision of an aviation medical officer, can assist in managing the requirement for defecation and managing menstrual blood flow.

2.244. **Design Requirement (Essential).** *CBRN ALSE masks must either interface with existing ICS equipment or contain ICS equipment with an equivalent level of performance.*

2.245. **Design Requirement (Essential).** *If a CBRN mask is to be used with supplemental oxygen, materials used in the mask must be assessed as suitably fire resistant, at the intended temperature ranges, and oxygen concentration levels to which the mask will be exposed by applying relevant materials standards and requirements prescribed within Section 3 Chapter 6.*

2.246. **Design Requirement (Recommended).** *CBRN ALSE should incorporate anti-suffocation and anti-drown protection as described by paragraph 11e of Air Force Interoperability Council Air Standard ASM 4067 Ed1 v2.*

2.247. **Key Considerations.** The following key considerations should be taken into account when introducing CBRN ALSE to ADF service:

(a) CBRN ALSE forms part of a CBRN protection capability. It cannot be effective without other elements of such a capability such as decontamination.

(b) CBRN ALSE can be used in a 'quick don' configuration. This could be used in the use cases of don prior to emergency egress from a CBRN protected platform, don for only part of a mission, or don in response to a detected CBRN threat. In the use case of don for part of a mission, a capability to confirm the absence of contamination prior to doffing is required. In the use case don in response to a detected CBRN threat, a CBRN threat warning mechanism is required.

(c) The user of CBRN ALSE intended for use in a 'quick don' role will require the ability to rapidly don and doff the equipment without assistance in the intended use environment. CBRN ALSE intended for permanent wear during missions can reasonably require the assistance of ALSE tradesmen or other crew members for donning and doffing.

Superseded

(d) Exposure to foreign object contamination such as dust, sea spray, water or large amounts of sweat can reduce the effectiveness or useful life of CBRN ALSE.

(e) Unaided speech communications with ground crew or passengers is expected to be difficult in some aviation environments. The use of CBRN ALSE can further hinder such communication. Features in a CBRN ALSE system to aid the ability of wearers to participate in unaided voice communications are desirable.

ADDITIONAL ALSE GUIDANCE

2.248. ALSLMU review and amend the ALSE Standards prescribed in this chapter on an ongoing basis with the aim to maintain contemporary and traceable design requirements for each ALSE Domain. Before applying ALSE standards prescribed in this chapter, ALSLMU must be engaged for the latest advice as published requirements may become obsolete as a result of these reviews.

2.249. Contact ALSLMU for advice or assistance in accessing referenced standards via ALSLMU.DeskOfficer@defence.gov.au.

Superseded

MISSION PLANNING SYSTEMS

INTRODUCTION

3.1 Computer-based Flight and Mission Planning Systems (hereafter referred to as MPS) provide substantial efficiencies for aviation flight and mission planning over traditional approaches. MPS consist of software applications that allow maps, charts, weather, intelligence and aircraft performance data to be used in developing navigation solutions (eg routes, approaches, terminal procedures), communication settings, flight and mission calculations (eg fuel, leg times), and other pertinent aeronautical data. MPS may include visual software tools optimised for specific aircraft roles, and automate the computations associated with aircraft specific flight/mission planning. Once the mission information has been generated, it is printed (eg kneeboards, strip charts), or alternatively written onto a data storage device (eg PCMCIA flash disk, or proprietary data transfer module) for transfer to aircraft systems (eg FMS, navigation system, EFB). Some modern MPS also include functions to transmit and receive flight/mission information via datalink, either at the commencement of a flight/mission, or as real time updates throughout a flight/mission. MPS may also be used for post-flight/mission debriefing.

3.2 With the advancement of performance based navigation, and the aircraft equipment that supports these types of navigation, MPS are being used in more challenging and potentially hazardous ways (eg aeronautical data supporting required navigation performance). Therefore, any MPS applications transferring, translating, manipulating or generating aeronautical information in this context should be designed and assured commensurate with the integrity requirements for the data they process.

Scope

3.3 This chapter presents the Authority prescribed airworthiness design requirements for MPS.

MPS DESIGN REQUIREMENTS

General MPS Requirements

3.4 **Design Requirement (Essential).** *The worst credible failure condition and the associated data criticality level for the aeronautical data produced by MPS must be established using formal System Safety tools and techniques.*

3.5 The above design requirement can be satisfied by following a defined systematic approach, as detailed in a system safety program, for identifying, analysing and evaluating hazards to determine the worst credible failure condition associated with the use of the MPS. The Authority prescribed system safety airworthiness design requirements are presented in:

(a) DASDRM Section 2 Chapter 2 – System Safety.

Superseded

3.6 The worst credible failure condition of the MPS can be used to determine the data criticality of the aeronautical data. The following data criticality levels are defined by the International Civil Aviation Organisation (ICAO) in Annex 15 (Chapter 3) to the Convention on International Aviation:

(a) **Critical data (Assurance Level 1).** The data if erroneous, would prevent continued safe flight and landing or would reduce the ability to cope with adverse operating conditions to the extent that there is a large reduction in safety margins or functional capabilities. There is a high probability when trying to use corrupted critical data that an aircraft would be placed in a life threatening situation.

(b) **Essential Data (Assurance Level 2).** The data if erroneous, would reduce the ability to cope with adverse operating conditions to the extent that there is a significant reduction in safety margins. There is a low probability when trying to use corrupted essential data that an aircraft would be placed in a life threatening situation; and

(c) **Routine Data (Assurance Level 3).** The data if erroneous, would not significantly affect aircraft safety. There is a very low probability when trying to use corrupted routine data that an aircraft would be placed in a life threatening situation.

3.7 The failure condition definitions for aeronautical data are intended to be compatible with the existing aircraft safety assessment process of MIL-STD-882 and ARP4754/4761, these correlate to the design assurance requirements of RTCA/DO-178C, as presented in Table 3–1. ICAO data criticality and data process assurance level are aligned to the existing failure condition definitions as shown in Table 3–1.

Table 3-1: Relationship between Failure Condition Categories and Data Process Assurance Levels

	RTCA/ DO-178C	ICAO Annex 15	RTCA/ DO-200B

Superseded

Superseded

MIL-STD-882 and ARP 4754/4761					
Failure Condition Category	**Effect**	**Design Assurance Level**	**Data Criticality**	**Definition**	**Data Process Assurance Level**
Catastrophic	Failure conditions that would prevent continued safe flight and landing.	A			
Hazardous / Severe Major	Failure conditions that would reduce the capability of the aircraft or the ability of the crew to cope with adverse operating conditions to the extent that there would be: (1) a large reduction in safety margins or functional capabilities, (2) physical distress or higher workload such that the flight crew could not be relied on to perform their tasks accurately or completely, or (3) adverse effects on occupants including serious or potentially fatal injuries to a small number of those occupants.	B	Critical	The data if erroneous, would prevent continued safe flight and landing or would reduce the ability to cope with adverse operating conditions to the extent that there is a large reduction in safety margins or functional capabilities. There is a high probability when trying to use corrupted critical data that an aircraft would be placed in a life threatening situation.	1
Major	Failure conditions that would reduce the capability of the aircraft or the ability of the crew to cope with adverse operating conditions to the extent that there would be, for example, a significant reduction in safety margins or functional capabilities, a significant increase in crew workload or in conditions Impairing crew efficiency, or discomfort to occupants, possibly including injuries.	C	Essential	The data if erroneous, would reduce the ability to cope with adverse operating conditions to the extent that there is a significant reduction in safety margins. There is a low probability when trying to use corrupted essential data that an aircraft would be placed in a life-threatening situation.	2

Superseded

Minor	Failure conditions that would not significantly reduce aircraft safety, and that would involve crew actions that are well within their capabilities. Minor failure conditions may include, for example, a slight reduction in safety margins or functional capabilities, a slight increase in crew workload, such as routine flight plan changes, or some inconvenience to occupants.	D				
No Safety Effect	Failure conditions that do not affect the operational capability of the aircraft or increase crew workload.	E		Routine	The data if erroneous, would not significantly affect aircraft safety. There is a very low probability when trying to use corrupted routine data that an aircraft would be placed in a life threatening situation.	3

3.8 **Design Requirement (Essential).** *The MPS must be assured to a level commensurate with the worst credible failure condition and data criticality level.*

3.9 The above requirement can be satisfied by applying appropriate validation and/or verification techniques along with the required level of software assurance as presented in Table 3-2. To allow an application of the relevant validation and verification design features and assurance requirements with MPS functional components, it is necessary to define a means of categorising MPS functions. In RTCA/DO-200B this is done using the data processing phases of receive, assemble, translate, select, format and distribute. However these terms are defined in the context of the whole aeronautical data process, and not just MPS components. Therefore, the ADF approach to MPS functions is to use the guidewords of Transfer, Format, Manipulation, and Generation for MPS components (defined in paragraph 13).

3.10 The guidewords, in conjunction with the data assurance level of the aeronautical data element in question, are used to determine which validation and verification techniques and assurance requirements need to be implemented by the MPS (refer Table 3–2). The alternative to validation and verification techniques identified in Table 3–2 is to assure that design faults that could introduce errors are absent. Of course, the absence of design faults cannot be conclusively demonstrated. Software assurance techniques are used to provide confidence, commensurate with the severity of failure, that design faults are absent.

Table 3-2: Design and Assurance Requirements for MPS Functions

Superseded

MPS Functional Guideword	Data Assurance Level	Validation and Verification Techniques	OR	Absence of Verification and Validation
Transfer	1 (Critical)	Digital Error Detection[1] OR Feedback / Readback Verify[2]	OR	MPS Components that perform the Transfer function are qualified commensurate with RTCA/DO-178C Level A or B
	2 (Essential)	Digital Error Detection[3] OR Feedback / Readback Verify[4]	OR	MPS Components that perform the Transfer function are qualified commensurate with RTCA/DO-178C Level C or D*
	3 (Routine)	No detection and handling required		
Formatting	1 (Critical)	Feedback / Reversibility Check[2] OR Independent Redundancy[5]	OR	MPS Components that perform the Formatting function are qualified commensurate with RTCA/DO-178C Level A or B
	2 (Essential)	Feedback / Reversibility Check[4] OR Independent Redundancy[5]	OR	MPS Components that perform the Formatting function are qualified commensurate with RTCA/DO-178C Level C or D*
	3 (Routine)	No detection and handling required		
Manipulation / Generation	1 (Critical)	Feedback / Reversibility Check[2] OR Independent Redundancy[5]	OR	MPS Components that perform the Manipulation / Generation function are qualified commensurate with RTCA/DO-178C Level A or B
		AND		
		Logical Consistency Checks OR Semantic Consistency Checks		
	2 (Essential)	Feedback / Reversibility Check[4] OR Independent Redundancy[6]	OR	MPS Components that perform the Manipulation / Generation function are qualified commensurate with RTCA/DO-178C Level C or D*
		AND		

Superseded

		Logical Consistency Checks OR Semantic Consistency Checks
	3 (Routine)	No detection and handling required

Notes:

1. MPS components that performs the Digital Error Detection should be qualified commensurate with RTCA/DO-178C Level A or B
2. MPS components that performs the Feedback should be qualified commensurate with RTCA/DO-178C Level C
3. MPS components that performs the Digital Error Detection OR Feedback / Readback Verify should be qualified commensurate with RTCA/DO-178C Level C or D
4. MPS components that performs the Feedback / Readback Verify should be qualified commensurate with RTCA/DO-178C Level D or Verification Tool Requirements
5. At least one of the MPS components that constitute the Independent Redundancy should be qualified commensurate with RTCA/DO-178C Level C or D
6. At least one of the MPS components that constitute the Independent Redundancy should be qualified commensurate with RTCA/DO-178C Level D or Verification Tool Requirements

* Note the difference between RTCA/DO-178C Level C and D is notable, and therefore the safety assessment process must make it explicit which severity failure condition the data element relates to. It also means there may be limitations to the extent to which tools used for Essential data in one context may be used in an alternative context.

Note that the Digital Error Detection qualification requirements (e.g., generate and check) are more onerous than the other verification techniques as the generated Digital Error Detection code is typically used by other downstream data processing tools/ steps for error detection.

3.11 The various validation and verification techniques that can be implemented are defined in:

(a) RTCA/DO-200B – Standards for Processing Aeronautical Data – Appendix C.

3.12 Software assurance levels and associated objectives are prescribed in:

(a) RTCA/DO-178C – Software Considerations in Airborne Systems and Equipment

3.13 The MPS functional guidewords used in Table 3-2 are defined below along with the suitable validation and/or verification techniques that can be applied:

(a) **Transfer.** The MPS directly transfers the source data to the data transfer device, in the same format, without change. This type of MPS function is suitable for protection using digital error detection mechanisms as described in RTCA/DO-200B Appendix C.

(b) **Format.** The MPS takes static source data, and through a set of pre-defined formatting requirements, reformats the source data into a new format for writing to the data transfer device. The extent of changes to the source data is confined to format changes (eg DAFIF to ARINC424), including the unit changes, word data type, and frame packing strategy. The unit changes (eg meters to feet) will involve some form of calculation. The MPS does not generate any new information as a result of dynamic source data or user input. Feedback and independent redundancy are the most suitable means of MPS components determining if errors have been introduced into the data, as described in RTCA/DO-200B Appendix C.

Superseded

(c) **Manipulation.** The MPS takes a combination of static and dynamic source data, and through a set of pre-defined requirements, manipulates (or translates) the source data for writing to the data transfer device. Manipulation may include the production of new information as a result of calculations based on static source data, but does not include the provision of data input by the user. Feedback and independent redundancy are the most suitable means of MPS components determining if errors have been introduced into the data, as described in RTCA/DO-200B Appendix C.

(d) **Generation.** Through a combination of static and dynamic source data, and keyboard input from the user, the MPS generates new data to be loaded onto the data transfer device. The validation methods described in RTCA/DO-200B Appendix C are the most suitable methods of ensuring the resultant generated data is valid.

Aeronautical Data Requirements

3.14 **Design Requirement (Essential).** *Aeronautical data produced by the MPS, with a data criticality of Critical or Essential, must meet the established data quality requirements prescribed in:*

(a) RTCA/DO-200B - Standards for Processing Aeronautical Data.

3.15 The aeronautical data quality requirements should be established by the user and supplier of the aeronautical data and be clearly documented. Aeronautical data quality is defined as the degree or level of confidence that the data provided meets the requirements of the user. Aeronautical data quality requirements include levels of accuracy, resolution, assurance, traceability, timeliness, completeness, and format. Data quality requirements are defined in RTCA/DO-200B.

MPS GUIDANCE

3.16 Further guidance on MPS acquisition/modification projects and in-service engineering support agencies can be provided by the chapter sponsor.

Superseded

ELECTRONIC FLIGHT BAGS

INTRODUCTION

4.1 An Electronic Flight Bag (EFB) is a digital information system for a flight deck crew member, which performs functions in support of flight operations or duties. EFBs can display a variety of aeronautical data or perform calculations (e.g. performance data, fuel calculations, etc.), and some EFB systems carry out more challenging functions not previously achievable with paper based products (e.g. interactive chart viewers, interactive checklists, navigation displays, datalink services, etc.). With EFB systems being used for more challenging and potentially hazardous functions it is imperative that EFB systems are designed with a level of integrity commensurate with their intended function.

Scope

4.2 This chapter presents the Authority prescribed airworthiness design requirements for EFB systems. The EFB design requirements are based largely on Federal Aviation Administration (FAA) and European Aviation Safety Agency (EASA) EFB guidance, however, unlike EASA/FAA the requirements in this chapter focus on technical issues whereas the FAA and EASA guidance also consider the operational management of EFBs to complement the technical requirements. The Authority is exploring whether operational regulations, and perhaps operational approvals, should be employed as an adjunct to the design requirements in this chapter. A decision on the need for operational regulation/approval should be made by mid-2022.

EFB AIRWORTHINESS DESIGN REQUIREMENTS

4.3 An EFB is a system comprising of hardware, a resident operating system, hosted software applications (maps, databases, etc.), and where required mounting components and physical interfaces for connecting to aircraft power and data ports, etc. An EFB may be designed to be installed as part of the aircraft configuration, be portable with a combination of installed hardware mounting components and physical connections, or be portable without physical connectivity to the aircraft. Installed elements of an EFB are considered to be an aircraft part and appliance per the DASR and are subject to aircraft type certification approval.

4.4 Portable EFBs are typically specific approval role equipment and the requirements prescribed in Section 5 Chapter 6 – Role Equipment and Portable Electronic Equipment are equally applicable and must be considered prior to authorising a portable EFB for use.

Identification and analysis of failure conditions

4.5 The potential failure effects of an EFB influence the hardware design, software design and level of integration required, and a system safety analysis needs to be undertaken to identify and analyse EFB failure conditions. Depending on the severity of the identified failure conditions an EFB may need to be installed into the aircraft.

Superseded

4.6 **Design Requirement (Essential).** *A system safety analysis must be utilised to determine the worst credible failure condition of the EFB.*

4.7 The usage of EFBs may introduce hazards that affect safe operation of Defence aircraft. For the initial EFB design and any subsequent modification to the design, a system safety analysis must be carried out to determine the worst credible failure condition of the EFB and each installed software application. The Authority prescribed system safety airworthiness design requirements are presented in Section 2 Chapter 2 – System Safety.

4.8 **Design Requirement (Essential).** *EFBs with a failure condition classified greater than Minor (FAA AC 2X.1309) must be installed into the aircraft and are subject to aircraft type certification approval.*

4.9 Portable electronic devices used as EFBs are typically not designed to be certified for aviation use and the lack of an aviation focus during their design makes it be difficult to achieve the required level of assurance for a failure condition greater than Minor (FAA AC 2x.1309). As a result portable EFBs are limited to hosting software applications with intended functions limited to a Minor (FAA AC 2x.1309) failure effect condition. EFBs that have been evaluated to have a worst credible failure condition greater than Minor (FAA AC 2x.1309) must have documented evidence demonstrating that the EFB hardware and software has been assured commensurate with the worst credible failure condition classification.

Portable EFB systems

4.10 Portable EFBs are generally COTS-based computers, considered to be PEE with no airworthiness design, production, or installation approval for the device with its internal components and applications limited to designs with a maximum failure condition of Minor (FAA AC 2X.1309).

4.11 **Design Requirement (Essential).** *Portable EFBs that have been evaluated to have a worst credible failure condition equivalent to Minor (FAA AC 2x.1309) must have documented evidence demonstrating that the EFB, operating system and hosted application software can perform the intended functions and do not provide false or misleading information.*

4.12 To demonstrate that the EFB and hosted software applications can perform the intended functions, the high level software requirements for the use of these applications on the EFB must be documented, and a verification program (functional and robustness) conducted. The verification program should assess the accuracy, availability and timeliness of the EFB applications. The verification program should also pay particular attention to the EFB operating system and hosted applications to demonstrate that they meet their intended function and do not provide confusing or misleading information. The above design requirement can be satisfied by complying with requirements detailed in the following documents:

(a) EASA Decision (ED) 2014/001/R – Airworthiness and Operational Considerations for Electronic Flight Bags, Annex II – AMC 20-25, or

(b) FAA Advisory Circular (AC) 120-76D – Authorization for Use of Electronic Flight Bags.

4.13 Depending on the intended use and concept of operation, portable EFBs used in aircraft may be secured on flight crew or in/to an existing aircraft part or have permanent arrangements to restrain the EFB and/or physically interface with the aircraft.

Superseded

4.14 **Design Requirement (Essential).** *Mounting and interfaces (if any) to aircraft shall form part of the aircraft type design and satisfy the applicable airworthiness requirements prescribed in the aircraft type certification basis.*

4.15 Where there is a need to have permanent arrangements for securing EFBs, or physically interface with the aircraft, any hardware associated with the interface is subject to aircraft type certification approval. The above design requirement can be satisfied by complying with requirements detailed in the following documents:

(a) EASA Decision 2014/001/R – Airworthiness and Operational Considerations for Electronic Flight Bags, Annex II – AMC 20-25, or

(b) FAA AC 20-173 – Installation of Electronic Flight Bag Components.

Installed EFBs

4.16 Installed EFBs with either a Minor (FAA AC 2X.1309) or greater than Minor (FAA AC 2X.1309) failure condition are integrated into the aircraft and will need to demonstrate compliance with the aircraft type certification basis.

4.17 **Design Requirement (Essential).** *Installed EFB hardware, operating system and applications must be designed to meet the safety objectives associated with EFB failure conditions and satisfy the applicable airworthiness requirements prescribed in the aircraft type certification basis.*

4.18 Guidance for installing EFBs and complying with the above requirement is detailed in the following documents:

(a) EASA Decision (ED) 2014/001/R – Airworthiness and Operational Considerations for Electronic Flight Bags, Annex II – AMC 20-25, or

(b) FAA Advisory Circular (AC) 120-76D – Authorization for Use of Electronic Flight Bags.

EFB GUIDANCE

4.19 Further guidance on EFBs is available through contacting the Chapter sponsor.

AERIAL DELIVERY OF MATERIEL

INTRODUCTION

5.1 Aerial delivery of materiel is the transport of cargo on ADF aircraft via three possible modes: internal air transport (Air Land (AL)) in fixed and rotary wing aircraft, Air Drop (AD) from fixed wing aircraft, and helicopter underslung load carriage (External Lift (EL)). Air Mobility Training and Development Unit (AMTDU) are responsible for the certification of cargo load items for transport via these three aerial delivery modes. Cargo load items interface with and have an appreciable effect on the safe operation of the carrying aircraft. Certification of cargo load items for aerial delivery (a load clearance) must adhere to the standards prescribed by this chapter to ensure the output of safe aerial delivery products.

5.2 When acquiring equipment with a requirement for aerial delivery, the Project Office or Defence organisation conducting the acquisition shall demonstrate compliance with all requirements relevant to the desired transport mode as listed under this Chapter to facilitate a successful aerial delivery clearance.

Scope

5.3 The design requirements prescribed in this Chapter are applicable to 'Australian Unique Loads'. This includes equipment (load items) acquired specifically for transport via ADF aircraft.

5.4 Load items with a current cargo load clearance from the US internal air transport load certification agency Air Transportability Test Loading Activity (ATTLA) or UK aerial delivery load certification agency Joint Air Delivery Test and Evaluation Unit (JADTEU) may be exempt from this standard. Contact AMTDU for further information.

AERIAL DELIVERY STANDARD

5.5 This chapter adopts the following US suite of standards and international standards for Aerial Delivery as the Authority prescribed criteria for the Aerial Delivery of Australian Unique Loads:

Air Land Standards

(a) MIL-STD-1791D Change 1 – Designing for Internal Aerial Delivery in Fixed Wing Aircraft

(b) MIL-DTL-27443F – Pallets, Cargo, Aircraft, Type HCU-6/E, HCU-12/E

(c) IATA Dangerous Goods Regulations (58th Edition)

(d) ISO Standards for Freight Containers (ISO668, ISO1161, ISO1496 Series, ISO3874)

Air Drop Standards

(e) MIL-STD-814D – Tiedown, Suspension & Extraction Provisions

Superseded

(f) MIL-HDBK-669 – Loading Environment and Related Requirements for Platform Rigged Airdrop Material (3 Feb 1997, Revalidated 11 Jun 2002)

(g) MIL-STD-1791-1 Criteria for Non-Standard Airdrop Equipment and Payloads (16 May 2016)

(h) US Manual FM 4-20.103/MCRP 4-11.3C/TO 13C7-1-11 – Airdrop of Supplies and Equipment: Rigging Containers (02 Sep 2005)

(i) AFIC AIR STD AM 4099 Criteria for the Design of Equipment Required to be Air Transported or Airdropped from Fixed Wing and Rotary Wing Transport Aircraft

External Lift Standards

(j) MIL-STD-913A – Requirements for the Certification of Sling Loaded Military Equipment for External Transportation

(k) USA ARMDL Technical Report 72-36 Design Guide for Load Suspension Points, Slings and Aircraft Hard Points (July 1972)

(l) AFIC AIR STD AM 4076 Technical Criteria for the Transport of Cargo by Helicopter

Standard Applicable to All Modes

(m) MIL-STD-209K – Interface Standard for Lifting and Tiedown Provisions.

5.6 Where the above adopted standards are unclear, unspecified or deficient, the following supplements are prescribed and are essential for Australian Unique Loads. Collectively, the standards prescribed at Paragraph 5.5 and the Australian supplements listed below form the Aerial Delivery Standard for Australian Unique Loads:

Air Land Supplements (Detailed in Annex A, Table 1)

(a) Restraint of secondary cargo (Item 1.4.2)

(b) Restraint analysis for load items restrained with lashings (Item 1.4.3)

Air Drop Supplements (Detailed in Annex A, Table 2)

(c) Impact survivability (Items 2.1.3 and 2.2.7)

(d) Energy dissipation system (Items 2.1.4 and 2.2.8)

(e) Restraint of secondary cargo (Item 2.2.10 – subordinate to Item 1.4.2)

(f) Restraint analysis for Air Drop load items restrained with lashings (Item 2.2.11 – subordinate to Item 1.4.3)

(g) Extraction provisions – Item extracted loads (Item 2.2.12)

(h) Suspension provisions – Item suspended loads (Item 2.2.13)

External Lift Supplements (Detailed in Annex A, Table 3)

(i) Load item lifting provisions – Strength (Item 3.1.3)

(j) Frame members (Item 3.1.5 – linked to Item 3.1.3)

(k) Spreader bars (Item 3.1.6 – linked to Item 3.1.3)

Superseded

(l) Restraint of secondary cargo (Item 3.4.1 – linked to Item 1.4.3)

(m) Applicability of general requirements (Item 3.1.7 – linked to Item 4.1.2)

Supplements Applicable to All Modes (Detailed in Annex A, Table 4)

(n) Shackles – Strength (Item 4.1.2)

(o) Secondary cargo tie down provisions – Strength (Item 4.2.3 – AD component only)

Supplements Applicable to Air Land and Air Drop (Detailed in Annex A, Table 5)

(p) Attachment point number (Item 5.1.2)

(q) Attachment point strength rating (Item 5.1.3).
Instruction and Guidance for Application of the Authority Prescribed Standard

5.7 All elements of the Aerial Delivery Standard that are applicable to a cargo load item and its desired mode(s) of transport are classified as 'essential' in accordance with the definitions contained in Section 1, Chapter 1.

5.8 Standards listed at Paragraph 5.5 may not be applicable in whole to a cargo load item for the selected aerial delivery mode(s). Annex A provides specific instruction and guidance on application of the Aerial Delivery Standard prescribed by the Authority at Paragraphs 5.5 and 5.6. Where the cited document is not publicly available, Annex A republishes the information for use in the Australian context.

5.9 The design data applicable to Australian aircraft is contained in the following documents and must be used in conjunction with the Aerial Delivery Standard prescribed at Paragraphs 5.5 and 5.6:

(a) TO 1C-17A-9 Loading Instructions C-17A Aircraft (or aircraft data from Appendix B.4 of MIL-STD-1791B)

(b) AAP7211.031-9 Loading Instructions Hercules C-130J-30

(c) AAP7211.045-9 C-27J Spartan Aircraft Cargo Loading and Offloading Manual

(d) AAP7210.026-1 Flight Manual Chinook CH-47F

(e) AAP7210.015-1 Flight Manual Black Hawk (S-70A-9)

(f) AAP7210.023-1 Flight Manual MRH90 Taipan

(g) Air Force Air Movements Manual

(h) AAP7279.001-1-1 Air Drop of Materiel General – Container Rigging and Associated Equipment

(i) AAP7279.001-1-2 Air Drop of Materiel General – Platform Rigging and Associated Equipment

(j) AAP7210.021-9-4 Helicopter External Load Rigging Procedures.

TAILORING OF AERIAL DELIVERY DESIGN REQUIREMENTS

5.10 Prescribing, revising and interpreting Aerial Delivery design requirements is the responsibility of the Defence Aviation Safety Authority, or if delegated, the Delegate of the Safety Authority (DoSA). Any proposed tailoring of the design requirements prescribed in this Chapter (including requests for

Superseded

deviations, modifications or special consideration) must be submitted to DASA/AMTDU for a determination on the acceptability of the tailoring.

REVISION NOTE

5.11 The content of this Chapter replaces DEF(AUST) 9009A Designing for Aerial Delivery of Equipment by Fixed and Rotary Wing Aircraft, dated 08 Jul 2009. The linkage between this Chapter and previous iterations of approved aerial delivery design standards is described in the below historical record of this standard.

Historical Record (all documents listed below are superseded)
RAAF Specification Engineering A5018
DEF(AUST) 9009 dated 19 Sep 2003
DEF(AUST) 9010 dated 29 Jul 2004
DEF(AUST) 9009A dated 08 Jul 2009

ANNEXES

ANNEX A - INSTRUCTION AND GUIDANCE FOR APPLICATION OF THE AERIAL DELIVERY STANDARD

INSTRUCTION AND GUIDANCE FOR APPLICATION OF THE AERIAL DELIVERY STANDARD

(a) This Annex contains instruction and guidance for application of the Aerial Delivery Standard cited at Section 5, Chapter 5, Paragraphs 5.5 and 5.6. This Annex consists of the following parts:

1. Part 1 – Applicable to load items to be internally transported by Defence fixed and/or rotary wing cargo aircraft, termed Air Land (AL) transport.
2. Part 2 – Applicable to load items to be air dropped by Defence fixed wing cargo aircraft, termed Air Drop (AD) transport.
3. Part 3 – Applicable to load items to be suspended beneath Defence rotary wing aircraft for the purposes of transporting items, termed External Lift (EL) transport (also commonly known as Helicopter Sling Loading (HSL)).
4. Part 4 – Applicable to attachment points, lifting provisions and cargo tie down provisions and is therefore applicable to load items to be transported via AL, AD and EL modes.
5. Part 5 – Applicable to attachment points used for AD and AL modes of transport.

MODE	PART 1	PART 2	PART 3	PART 4	PART 5
Air Land (AL)	✓	N/A	N/A	✓	✓
Air Drop (AD)	✓	✓	N/A	✓	✓
External Lift (EL)	Item 1.4.3 (for item restraint)	N/A	✓	✓	N/A

(b) Definitions for the verification methods are contained at Annex B of Section 5, Chapter 5. Unless otherwise specified, only one of the listed verification methods for each design requirement needs to be applied.

PART 1 – AIR LAND TRANSPORT CERTIFICATION REQUIREMENTS AND VERIFICATION

(a) Table 1 presents instructions and guidance for application of the Aerial Delivery standard for AL transport via fixed and rotary wing aircraft. Table 1 makes reference to United States and international standards (as cited by Section 5, Chapter 5, Paragraph 5.5) to establish the requirement with some Australian supplements (as cited by Section 5, Chapter 5, Paragraph 5.6). The Australian Air Publications are used for design data. Where the international

Superseded

standards refer to Air Transportability Test Loading Activity (USAF), AMTDU is the applicable agency.

(b) The following standards and publications contain the relevant requirements and design data, and are to be read in conjunction with this part:

Adopted Standards (as cited by Section 5, Chapter 5, Paragraph 5)

1. MIL-STD-1791D Change 1 – Designing for Internal Aerial Delivery in Fixed Wing Aircraft
2. MIL-DTL-27443F Pallets, Cargo, Aircraft, Type HCU-6/E, HCU-12/E
3. IATA Dangerous Goods Regulations (58th Edition)
4. ISO Standards for Freight Containers (ISO668, ISO1161, ISO1496 Series, ISO3874) Relevant Guidance Documents
5. MIL-STD-810G Environmental Engineering Considerations and Laboratory Tests

Design Data

6. AAP7211.031-9 Loading Instructions Hercules C-130J-30 (Section 4)
7. TO 1C-17A-9 Loading Instructions C-17A Aircraft (Section 4) or aircraft data from Appendix B.4 of MIL-STD-1791D Change 1
8. AAP7210.026-1 Flight Manual Chinook CH-47F (Chapter 6)
9. AAP7211.045-9 C-27J Spartan Aircraft Cargo Loading and Offloading Manual (Section 4)
10. AAP7210.023-1B Flight Manual MRH90 Taipan (Section 1)
11. AAP7210.015-1 Flight Manual Black Hawk (S-70A-9) (Section 8)
12. Air Force Air Movements Manual.

Table 1 – Air Land Transport Certification Requirements and Verification

Item	Instruction for Application of Standard	Guidance	Verification
Load Item Size			
1.1.1	Cargo Compartment Clearances Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.1.1 noting the following Australian aircraft design data applies: i. The cargo compartment dimensions for the applicable ADF aircraft as	Load items meeting these requirements facilitates compatibility with the applicable ADF aircraft. The design of load items should be such that they can be loaded aboard ADF aircraft in their air transport configuration (which may include secondary cargo, see guidance under Item 1.4.2)	Demonstration (as required) *or* Inspection

Superseded

	defined in the reference material listed at Part 1, Paragraph 2. ii. Loading clearances as per AFAMMAN: a. Compartment inflight clearance of 5in from the aircraft structure applies for sprung cargo. b. Compartment inflight clearance of 3in from aircraft structure applies for un-sprung cargo. c. A loading/ unloading clearance of 1in from the aircraft structure applies.	whenever possible. The design goal is to qualify items for Air Land transport under the most restrictive combination of requirements. When necessary, sectionalisation or partial disassembly of items may be performed as a means of achieving this goal; however, care should be taken not to exceed the user's organic capability to reassemble the load item within a specified time period under field conditions. When considering the aircraft limits, the load item's air transport configuration is to be kept in mind. For example, the load item's air transport size and weight are to include any secondary cargo attached during transport. During the design phase, inspection or analysis are more suitable methods for verification. AMTDU will also typically conduct a load trial to demonstrate that these requirements are met, particularly where a load item closely approaches the specified limits.	
1.1.2	Projection Limits Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.1.1.1 noting that the projection limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.		Demonstration (as required) *or* Inspection
1.1.3	Vehicle Overhang Refer to MIL-STD-1791D Ch1 Section 5, Clause 5.3.1.1.2 noting that the vehicle overhang limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.		
1.1.4	Ramp Cresting Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.1.1.3 noting the following Australian aircraft design data applies: i. The ramp cresting limits for the applicable ADF aircraft		Demonstration (as required) *or* Inspection

Superseded

	as defined in the reference material listed at Part 1, Paragraph 2. ii. Loading clearance of 1in clearance from the ramp crest (as per AFAMMAN) applies.		
1.1.5	Emergency Access Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.1.1.5. The safe passageway (access aisle) for ADF aircraft is defined in AFAMMAN (Part 5 Sect 1 Chap 2).		Demonstration (as required) *or* Inspection
Item Weight Limits			
1.2.1	Gross Weight and Centre of Gravity Refer to: i. MIL-STD-1791D Ch1, Section 5, Clause 5.3.2.1. ii. Item 4.1.8(vii) for Centre of Gravity marking. The gross weight and centre of gravity limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.	Load items meeting these requirements facilitates compatibility with the applicable ADF aircraft. This applies to all Item Weight Limit Clauses (1.2.1 – 1.2.8)	Analysis (i) Inspection (ii)
1.2.2	Aircraft Compartment Limits Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.2.2 noting the aircraft compartment limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.		Analysis
1.2.3	Aircraft Roller Conveyer Limits		Analysis

Superseded

	Refer to MIL-STD-1791D Ch1, Section 5, Clause, 5.3.2.3 noting the aircraft roller conveyer limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.		
1.2.4	Concentrated Load, Linear Loads, Tongue Loads, Axle Loads and Axle Spacing Limits, Wheel/Tyre Loads Refer to MIL-STD-1791D Ch1, Section 5, Clauses 5.3.2.4, 5.3.2.5, 5.3.2.6, 5.3.2.7, 5.3.2.8 and 5.3.2.9. The concentrated load, linear loads, tongue loads, axle loads and axle spacing limits, wheel/tyre loads limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.	It is recommended that load items are designed to use the higher capacity treadway sections of the aircraft floor.	Analysis
1.2.5	Vehicle Suspension Limits Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.2.12.	This requirement ensures that the vertical down restraint required by item 1.4.1 is achieved.	Inspection *or* Analysis *or* Test
1.2.6	Ramp Hinge Limits Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.2.13 noting the ramp hinge limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.		Inspection
1.2.7	Tracked Vehicles Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.2.11 noting the tracked vehicle limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.	Note that the shoring requirements differ between C-130J and C-17 aircraft. The minimum shoring requirements are 1/2in or at least the depth of the grouser for C-17A and 3/4in for C130. CH-47D, CH-47F and C-27J do not currently have published limits for tracked vehicles. If required, consult AMTDU for further information.	Analysis

Superseded

1.2.8	Solid Wheel Loads Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.2.10 noting the solid wheel load limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.		Analysis
Special Equipment			
1.3.1	Special Tools and Transportability Equipment Refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.7.4.	The need for specialised tools and ground support equipment to prepare and load/offload cargo items is to be avoided to the maximum extent consistent with mission requirements. Where such tools/equipment is required, the type and quantity is to be identified and reported to the procuring activity or program office so that this may be communicated to AMTDU.	Inspection *and* Demonstration
1.3.2	Material Handling Equipment (MHE) Where MHE is required, refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.7.4.1.	Where specialist or purpose built MHE is required to assist in item disassembly/assembly and loading, it is to be within the organic capability of the using unit to make the load item operationally ready within the specified time and personnel constraints.	Inspection *and* Demonstration
1.3.3	Shoring Requirements: Approach, Rolling, Parking, Bridge, and Sleeper shoring Should the use of shoring be unavoidable, refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.7.1. The shoring requirements for the applicable ADF aircraft are defined at AFAMMAN (Part 5, Sect 1, Chap 1).	Items should incorporate features which enhance their handling characteristics so that they can be on/off loaded without the use of shoring. The use of any type of shoring is to be avoided to the maximum extent possible as shoring often causes logistical difficulties for air transport. If the load item's weight exceeds the non-treadway cargo compartment limits of the aircraft, it is to be designed to use the higher capacity	Analysis *and/ or* Demonstration

Superseded

		treadway sections of the aircraft floor. In all cases, loads imposed by such load items are not to exceed limit loads as defined in the reference material listed at Part 1, Paragraph 2. The load item designer is to apply all reasonable effort to design out the need for shoring before shoring use is permitted. Where shoring is unavoidable, it is beneficial for the load item designer to consider including a purpose designed shoring kit as part of the load item air transport configuration.	
Load Item Restraint			
1.4.1	Restraint Load Factors The load item is to: i. Be capable of surviving the conditions specified at MIL-STD-1791D Ch1, Section 5, Clause 5.3.3. ii. Be restrained under the conditions specified at MIL-STD-1791D Ch1, Section 5, Clause 5.3.3.1 with the following addition for rotary wing aircraft: **Restraint Load Factors for Internal Carriage of Cargo (AL)** **(Adopted from AFIC AIR STD AM 4076)**	When designing the load item, the designer is to consider the how the User will apply and achieve the required restraint.	Analysis

Direction	Load Factor[1] (Rotary Wing AL)
Up	2.0 G

Superseded

	Down	4.0 G		
	Forward	4.0 G		
	Aft	2.0 G		
	Lateral	1.5 G		
	[1]Factors are used to determine ultimate loads. The load item need not remain functional but is to maintain unitary integrity; the load item structure may yield but not break.			
1.4.2	Restraint of Secondary Cargo If a requirement exists for the load item to be air transported with secondary cargo, refer to MIL-STD-1791D Ch1, Section 5, Clauses 4.3.6.3b and 5.3.6.8. Items of any mass that are able to puncture the walls of its containing device are to be restrained to the requirements of the primary item. Loose items of low mass (an individual item weighing less than 50lb) are not subject to the above restraint requirement, however, are to be securely restrained to prevent them from becoming a hazard. Restraint of secondary cargo is to be determined in accordance with Item 1.4.3. (Australian Supplement)	For this requirement, secondary cargo refers to any item intended to be transported with the primary load item as a unit such as internal items, auxiliary equipment and integral equipment. This can include (but is not limited to) cargo carried by vehicle/trailers, internal cargo within a containing device, purpose built mission modules and integral items such as jerry cans, fire extinguishers spare wheels carried using purpose built provisions. General cargo and other Load Items which can be transported within a containing device are subjected to the same acceleration forces as the containing device. Restraint of the containing device itself does not necessarily result in adequate restraint of the cargo items internal to the containing device. Unless these cargo items are independently restrained to appropriate levels, they become damaged under the influence of flight loads or may, at the extreme, deform the container walls and may cause damage to the aircraft.	Analysis

Superseded

		Any item stored in a containing device is to be secured to meet the inflight restraint requirements. Most containing devices may also be designed to carry auxiliary equipment or have built-in equipment for the mission of the unit. This can be met by placing cargo tie down provisions within the containing device (as per items 4.2.1 – 4.2.6) and securing the equipment to these rings. Holding stanchions can also be used for the equipment. The guidance from MIL-STD-1791D Ch1, Appendix A, A.9.7 is to be followed for items of low mass.	
1.4.3	Restraint Analysis for Load items Restrained with Lashings The available restraint for a load case is the sum of all lashing force components corresponding to the direction of the load case under analysis. The lashing force component must be calculated using its rated strength and angle of application (see MIL-STD-1791D Ch1, Appendix A, Clause A.4.2.2 for guidance). The following conditions also apply (Australian Supplement): i. When assessing the strength capacity of the attachment point for use in the restraint pattern, all force components resulting from the applied lashing(s) are considered to act simultaneously. ii. Lashings contributing to available restraint for a	AMTDU is responsible for ensuring this requirement is met. Nonetheless, awareness of this requirement is important during load item design. Restraint of load items is achieved by application of lashings (typically CGU-1/B (5k lbf), MB-1 (10k lbf) or, MB-2 (25k lbf) chains for AL and Dacron straps (6k or 10k lbf) for AD) from the load item's attachment points to the aircraft floor rings or load item's cargo tie down provisions (for restraint of primary or secondary items respectively). A 'restraint pattern' is the collective use of the above elements. A 'load case', for the purposes of restraint analysis, is the loading condition produced by the inertial forces of the load item's air transport configuration mass after application of the restraint load factor (as obtained from	Analysis

Superseded

	particular load case are applied at similar lengths and angles. iii. Lashings are symmetrically distributed about the Load Item's centre of gravity. iv. No mixing of different lashing types (e.g. chains of different rated strengths, or mixing of chains and straps) is permitted. v. The strength contribution of all lashings must be de-rated to the strength of the weakest element of the restraint pattern for the load case being analysed. vi. Friction is not included in determination of available restraint. vii. Lashings must have an unimpeded, straight line of action from the floor to the attachment point. viii. A minimum of four lashings are to be used.	Table 1-1) in a particular direction. This inertial load is considered to be statically applied. A length and angle variation of less than approximately 20% is acceptable for (ii). If (ii), (iii) and (iv) are satisfied, lashings can be considered to load at the same rate. Otherwise, a detailed analysis based on lashing stiffness (a function of length, angle, distribution and lashing type) is required. Where multiple lashings are used for a single attachment point, consideration should be given to all forces from the applied lashings acting on the attachment point.	
Air Land Transport Environment			
1.5.1	Shock and Vibration For fragile items or items sensitive to shock and vibration including (but not limited to) Nuclear, Biological, Chemical Cargo and Explosive Ordnance), refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.5.1.	This design requirement is to be complied with where shock and vibration may impact on item serviceability, structural integrity or safety. The test methods detailed under Methods 514.7 and 516.7 MIL-STD-810G may be used for verification of the vibration and shock requirements. The vibration spectrum of the air transport environment for the	Analysis *or* Test

Superseded

		different modes and different aircraft is to be requested from the relevant Aircraft Systems Program Offices. For C-130J aircraft, the power spectral density data of DEF STAN 00-35 Part 3, Chapter 2-01 Annex A, A.2.5 may be used. If this design requirement is deemed to be not applicable, the Project Office responsible for the load item is required to provide a statement to AMTDU certifying that the shock and vibration introduced by the air transport environment will not adversely affect the load item serviceability, structural integrity or safety.	
1.5.2	Rapid Decompression If pressure vessels are being transported refer to MIL-STD-1791D Ch1, Section 5, Clause 5.3.5.2.	This clause is applicable to load items designed to contain a fluid within a designated pressure vessel.	Analysis *or* Test
1.5.3	Hazardous Materials/Inflight Requirements/Venting Where the load item is capable of carrying or having attached to itself hazardous materials, the containment or packaging of these materials is to be in accordance with the IATA Dangerous Goods Regulations.	The containment, packaging, or other preparation of these materials is to be performed and certified such that they do not jeopardise the safety of cargo handlers, flight crews, or the aircraft.	Inspection
Additional Requirements for Containers, Shelters and Cabins (Containing Devices)			
1.6.1	Containing Devices – General Containing devices are to meet the following ISO standards: ISO 668 Classification, Dimensions and Ratings ISO 1161 Freight Containers – Corner Fittings	Reassessment or recertification after modification of a containing device is the responsibility of the load item designer. Modifications of a containing device which may invalidate the original ISO certification include (but are not limited to):	Inspection *(for compliance to ISO)* Analysis *or* Test *(for modified container strength)*

Superseded

	ISO 1496 Series – Freight Containers (as applicable to the container type) ISO 3874 (Clause 4.2.4) Should the containing device be modified after issue of its ISO certification, an assessment of the containing device's structural integrity and attachment points' (corner points) strength is to be conducted to ensure the original certification remains valid.	i. container wall panel cut-outs ii. changes to the container frame iii. permanent installation or removal of integral equipment iv. changes to the corner attachment point(s) v. changes to the cargo tie down provisions available	
1.6.2	Size and Weight Limitations for Air Transport of Containing Devices The overall size and gross weight of containing devices is to meet: i. MIL-STD-1791D Ch1, Clause 5.3.2.14 and Table II (for 463L Pallets). Any weight limitations are to be indelibly marked on the containing device. ii. The roller conveyor limitations (see Item 1.2.3)	Consideration should also be given to: i. The availability of sufficient attachment points on the containing device and the aircraft floor to sufficiently restrain the load item to the inflight restraint criteria. ii. Containing devices of a length greater than the equivalent of a train of three pallets have less operational flexibility due to the necessary MHE required for loading/ unloading not always being available in some locations. iii. The ADF does not have MHE that can load/unload items of	Inspection

Superseded

		a length greater than the equivalent of a train of five pallets.	
Load Items to Interface with the 463L System			
1.7.1	463L System Compatibility A load item to be transported on its own base or which incorporates an integral pallet base is to be designed to be compatible with the 463L air cargo handling system. Refer to MIL-STD-1791D Ch1 Clause 5.3.6.7. Configuration of the aircraft cargo handling systems for the applicable ADF aircraft are defined at Paragraph 2. The aircraft roller limits for the applicable ADF aircraft are defined in the reference material listed at Part 1, Paragraph 2.	Smaller items which can be palletised should be designed to take maximum advantage of the weight and cube capability of the HCU-6/E pallet. Load items designed with a 463L compatible base may be of custom length provided consideration given to the weight and roller conveyor limits. For example, the weight of a load item with length equal to two and half 463L pallets may be up to two and a half times the maximum rigged weight of a single 463L pallet (10,355lb x 2.5 = 25,888lb). The load item mass is to be distributed uniformly along its length to ensure roller and linear load limits are not exceeded. Consideration should be given to the guidance provided for Item 1.6.2 (see guidance 1.6.2 (i) and (ii)). If there is difficulty in accessing the listed drawings from MIL-DTL-27443, AMTDU can be contacted for assistance.	Inspection *and* Demonstration

Superseded

PART 2 – AIR DROP CERTIFICATION REQUIREMENTS AND VERIFICATION

(a) Table 2 presents instructions and guidance for application of the Aerial Delivery standard for AD transport via fixed wing aircraft. Table 2 makes reference to United States and international standards (as cited by Section 5, Chapter 5, Paragraph 5.5) to establish the requirement with some Australian supplements (as cited by Section 5, Chapter 5, Paragraph 5.6). The Australian Air Publications are used for design data. Where the international standards refer to U.S. Army Soldier Systems Center, AMTDU is the applicable agency. Additional background information on available air drop types and methods is provided at paragraphs 4 to 6.

(b) The following standards and publications contain the relevant requirements and design data, and are to be read in conjunction with this part:

Adopted Standards (as cited by Section 5, Chapter 5, Paragraph 5)

1. MIL-STD-814D – Tiedown, Suspension & Extraction Provisions
2. MIL-HDBK-669 – Loading Environment and Related Requirements for Platform Rigged Airdrop Material (3 Feb 1997, Revalidated 11 Jun 2002);
3. US Technical Memorandum ASD-TM-77-1 Criteria for Non-Standard Airdrop Loads (August 1992)
4. US Manual FM 4-20.103/MCRP 4-11.3C/TO 13C7-1-11 – Airdrop of Supplies and Equipment: Rigging Containers (02 Sep 2005)
5. AFIC AIR STD AM 4099 Criteria for the Design of Equipment Required to be Air Transported or Airdropped from Fixed Wing and Rotary Wing Transport Aircraft

Design Data

6. AAP7279.001-1-1 Air Drop of Materiel General – Container Rigging and Associated Equipment
7. AAP7279.001-1-2 Air Drop of Materiel General – Platform Rigging and Associated Equipment.

(c) Design requirements for the air drop of ammunition are not included in this standard; air drop of ammunition is to be considered on a case by case basis.

(d) Types of Air Drop:

1. **Free Drop** – Free drop is the delivery of non-fragile items without the use of parachutes or other retarding device. Items, which are to be delivered by free drop, require special preparation to prevent damage from landing shock. Items such as liquids require durable, flexible containers, while other items require padding or special containers. Free drop is only performed with small robust items.
2. **High Velocity Air Drop** – High velocity air drop is the delivery of items rigged in air drop containers with Energy Dissipating Material (EDM) attached to the underside of the load and a stabilising device, such as a small parachute packed for high velocity air drop attached to the top of the load. The stabilising device is designed to minimise oscillation of the load and to create just enough drag to hold the load upright during descent so that it will land on the EDM. The design rate of descent for high velocity drop is 21 to 27 m/sec (70 to 90 ft/sec). High velocity is only performed with container loads.
3. **Low Velocity Air Drop** – Low Velocity Air Drop (LVAD) is the delivery of various items or supplies and equipment with the use of cargo parachutes and Energy Dissipating Material (EDM) attached to the underside of the load. Loads are prepared for air drop either by packing the items in air drop containers or by rigging them to platforms or skidboards. Cargo parachutes are then attached to the load or to the platform to retard the descent of the load and to ensure minimum landing shock. The design rate of descent for low velocity drop is 8 m/sec (28.5 ft/sec) or less.

Superseded

(e) Methods of Air Drop:

1. Ramp or Door – Using the ramp or door method, the loads are manually ejected from the aircraft.

2. Gravity Extracted Load – In the gravity method of air drop, the load restraining ties are released manually, mechanically or by a release parachute. This allows the load to roll out of the cargo compartment of the aircraft.

3. Extraction – In the extraction method, an extraction parachute pulls the load out of the cargo compartment. This method is used to extract loads rigged on airdrop platforms. Refer to AAP 7279.001-1-2.

(f) Types of Air Drop Loads:

1. **Container loads** – Container loads is a term used to group together the methods of air dropping supplies contained either with a number of straps or within a specifically designed webbing container. Container loads can be door bundles, compacts, A22 containers or Alternate Container Delivery System loads (ACDS).

2. **Door Bundles** – Door bundles are generally small container loads delivered from the side door of the drop aircraft, rigged to comply with the specific delivery aircrafts dimensional and weight limitations.

3. **Compacts (Ramp Bundles)** – Compacts are generally referred to as a small container load weighing no more than 500lbs. Within the ADF, compacts are delivered from the ramp of the drop aircraft.

4. Platform suspended, platform extracted – Platform suspended loads are air drop loads delivered generally on a Type V air drop platform using the integral platform side rail suspension points to suspend the load. Platform extracted loads utilise the Type V platform extraction bracket which is integral to the platform to extract the load from the aircraft.

5. Item suspended, item extracted – Item suspended loads are loads suspended under the parachute using some part of the load item. Item extracted loads use a part of the load item to connect the extraction parachute to extract the load from the aircraft.

6. **Item suspended, platform extracted** – Item suspended loads are loads suspended under the parachute using some part of the load item. Platform extracted loads utilise the Type V platform extraction bracket which is integral to the platform to extract the load from the aircraft.

(g) The suitability of an air drop method and type for a load item depends on the load item's ability to satisfy the appropriate design requirements listed in Table 2.

Table 2 – Air Drop Transport Certification Requirements and Verification

Item	Instruction for Application of Standard	Guidance	Verification
CDS – Door Bundles , Compacts, A-21 Container Loads and A-22 Container Loads			

Superseded

2.1.1	Dimensions The dimensions are not to exceed the value published for the applicable ADF aircraft and container delivery method as defined at AAP7279.001-1-1 Section 4. A lateral clearance of 50 mm (2 in) is required around the load when fitted to the skidboard to allow clearance between the load item and the aircraft centre line vertical Restraint or side rail system. (Sourced from US Manual FM 4-20.103/MCRP 4-11.3C/TO 13C7-1-11, Table 2-2)	The allowable dimensions for a given container delivery method may vary between aircraft types. The maximum height published in the AAPs includes the skid board and parachute.	Inspection
2.1.2	Weight The suspended weight is not to exceed the value published for the applicable ADF aircraft and container delivery method as defined at AAP 7279.001-1-1 Section 4. The rigged weight divided by the largest surface area of the load item is to be greater than the value published in AAP 7279.001-1-1 Section 4. (Sourced from US Manual FM 4-20.103/MCRP 4-11.3C/TO 13C7-1-11, Paragraph 1-1 and 1-6)	The term surface area loading is not used in AAP 7279.001-1-1; this term refers to the load item mass divided by the platform area.	Inspection
2.1.3	Impact Survivability (Australian Supplement) The requirement from item 2.2.8 applies to CDS loads.	See guidance provided for items 2.2.7 – 2.2.8.	See Item 2.2.7
2.1.4	Energy Dissipation System (Australian Supplement) Energy dissipation systems for air drop must be designed to support deceleration forces equivalent to the G loading forces in Table 2-1.		See Item 2.2.8
	Platform Load Limitations		
2.2.1	Air Land Requirements The Air Land requirements detailed under Part 1, Items 1.2.3 (Roller Conveyor Limits), and 1.5.1 – 1.5.3 (Inflight environment requirements) apply to the Air Drop item in the rigged configuration.	The Air Drop item is classified as an Air Land load until it is released from its restraint(s) to the aircraft for despatch. Compliance with the identified requirements is therefore essential	See items 1.2.3, 1.5.1 – 1.5.3

Superseded

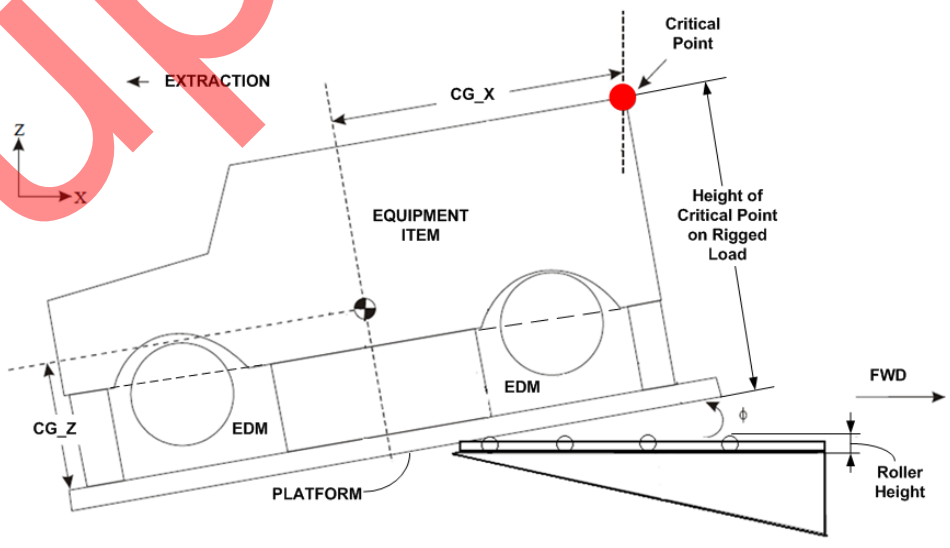
		for platform air drop loads.	
2.2.2	Weight The rigged weight of the air drop item is to be within the range published at AAP 7279.001-1-2 Section 1 Chapter 6 for the chosen platform length. The minimum rigged weight per platform surface area is to be greater than the value published at AAP 7279.001-1-2 Section 1 Chapter 5. The maximum suspended weight is not to exceed the value published at AAP 7279.001-1-2 Section 3 Chapter 1 for the chosen platform length. (Sourced from ASD-TM-77-1, August 1992, Paragraph 9)	AMTDU is responsible for the determination of the configuration and the certification of the rigged air drop load. The Type V platform is available in multiple lengths (8ft, 12ft, 16ft, 20ft, 24ft and 32ft). The choice of platform length is dependent on (but not limited to) the CONOPs, the size, shape, weight and centre of gravity of the air drop item. AMTDU is responsible for the selection of a suitable platform length for a given air drop item. Nonetheless, this requirement is to be considered during load item design. The weight of ADE components can be found at AAP 7279.001-1-2. Platform loading is determined using the weight of the air drop item and ADE (excluding platform) and the platform area. As this is dependent on the length of the selected platform, AMTDU is responsible for ensuring this requirement is met. Nonetheless, awareness of this requirement is	Analysis

Superseded

		important during load item design.	
2.2.3	Centre of Gravity The CoG of the completely rigged air drop platform (including an accompanying load if applicable) is to be positioned (longitudinally, laterally and vertically) such that the limitations shown in AAP 7279.001-1-2 Section 1 Chapter 7 are met. (Sourced from ASD-TM-77-1, August 1992, Paragraph 10 and Figure 6)	Longitudinal and Lateral position limits for the platform may be obtained from Figure 1-7-1 of AAP 7279.001-1-2. Vertical position limits are shown at S1C7 Item 3 of AAP 7279.001-1-2.	Analysis or Test
2.2.4	Hang Angle The platform should be approximately parallel to the impact surface prior to drop (Refer to MIL-HDBK-669, Clause 6.1.2).	This requirement exists to reduce damage to the platform and load item on impact. Awareness of this requirement is important during load item design to promote an even weight distribution of the load item. As this is dependent on the positioning of items on the platform, AMTDU is responsible for ensuring this requirement is met. This requirement applies to the hang angle of the rigged air drop platform without the parachute(s). 'Approximately parallel' practically translates to a maximum gradient of one inch per foot of platform length.	Test
2.2.5	Dimensions – Height The height of the rigged air drop item is limited by the critical point during the tip-off phase of air drop (See Figure 2-1). The critical point is to adequately clear the	In the first instance, the maximum allowable height of the rigged air drop load can be estimated using MIL-STD-1791D Ch1	Analysis (required) and Test (required at AMTDU discretion)

Superseded

	surrounding aircraft structure during all phases of air drop transport. The height requirements of items 1.1.1 and 1.1.2 are also applicable. (Sourced from ASD-TM-77-1, August 1992, Paragraph 8)		Figures B-77 (C-17A aircraft) and B-103 (C-130J aircraft). The tip-off phase of air drop occurs once the centre of gravity of the rigged load passes over the edge of the aircraft ramp. This causes the rigged load to rotate as it exits the aircraft. The point most likely to strike the aircraft during rotation is the critical point. See Figure 2-1. As a guide, 5in is considered adequate clearance from the surrounding aircraft structure Load item designers should consider that the allowable height of the rigged air drop item includes several layers of Energy Dissipating Material and the Type V platform thickness (a typical estimate for this is 15in) placed beneath the load item.	



Superseded

<table>
<tr><td colspan="4">Figure 2-1 – Tip-off phase during air drop</td></tr>
<tr><td>2.2.6</td><td>Dimensions – Length and Width

The length and width of the air drop item are to conform to the selected platform dimensions published in 7279.001-1-2 Section 1 Chapter 6 and overhang requirements as published at AAP 7279.001-1-2 Section 1 Chapter 5.

The length and width requirements of Item 1.1.1 are also applicable.

(Sourced from ASD-TM-77-1, August 1992, Paragraphs 8 and 9)</td><td>The dimensions of the rigged air drop loads are dependent on (but not limited to) impact mitigation design and parachute placement. AMTDU is responsible for ensuring this requirement is met. Nonetheless, awareness of this requirement is important during load item design to allow development of a suitable configuration.</td><td>Analysis</td></tr>
<tr><td>2.2.7</td><td>Impact Survivability (Australian Supplement)

Load items must be capable of sustaining minimum vertical deceleration forces (G loading) from Table 2-1 without any detrimental effect on the load item’s function or structure.

Table 2-1 – Vertical deceleration acceleration factors (G loading) for load items to be air dropped

<table><tr><td>Type of load item</td><td>Minimum G Loading</td></tr><tr><td>Mass Loads (robust items)</td><td>28</td></tr><tr><td>Military Spec Vehicles</td><td>MIL-HDBK-669, Section 5, Clause 5.4</td></tr><tr><td>Commercial Earthmoving Equipment</td><td>20</td></tr><tr><td>Commercial Motor Vehicles</td><td>12</td></tr></table></td><td>Flat contact surfaces of sufficient strength to support the impact loads on the underside of the load item (primary structure is ideal) will enable design of a successful energy dissipation system. Surfaces should also be evenly distributed about the load item’s centre of gravity. Load item designers are advised to consider this to facilitate a successful AD load certification

On a typical configuration, the deceleration force of 20G will be met by using 3.1 square feet of energy dissipating crushing area for each 1000 pounds of item air drop weight and a total thickness of 12 inches of EDM composed of four</td><td>Analysis, Test</td></tr>

	All factors are used to determine yield loads. The load item is not to exhibit permanent deformation upon application of these factors. The load item is to be capable of sustaining an ultimate load of not less than 1.5 times the DLL.		
2.2.10	Restraint of Secondary Cargo (Australian Supplement) The requirement specified by item 1.4.2 applies in conjunction with the applicable restraint load factors for Air Drop from Table 2-2.	See guidance for Item 1.4.2.	See Item 1.4.2
2.2.11	Restraint Analysis for Air Drop Load items Restrained with Lashings (Australian Supplement) Item 1.4.3 applies to determining restraint of all air drop load items restrained using lashings.	See guidance for Item 1.4.3	See Item 1.4.3
2.2.12	Extraction Provisions – Item Extracted Loads The working limit load (or DLL) of the extraction provision is equal to aft load factor from Table 2-2 for item extracted loads multiplied by the rigged weight of the air drop item applied in the direction of extraction. The sustainable ultimate load is not to be less than 1.5 times the DLL. (Australian Supplement) Refer to MIL-STD-814D, Section 5, Clause 5.3.2.1 and 5.3.2.4 for extraction provisions dimensions and location, respectively. The general requirements of items 4.1.1 to 4.1.5 and 4.1.8 of this standard apply to extraction provisions. (Item 4.1.2 is an Australian Supplement)	Item extraction is not the preferred method of extraction. The project is to request advice from AMTDU for the applicability of this method to the load item requiring certification. While MIL-STD-814 states that extraction provisions are to be positioned below the CG, extraction provisions should ideally be positioned as low as possible on the load item.	Analysis orTest
2.2.13	Suspension Provisions – Item Suspended Loads Refer to MIL-STD-814D, Section 5, Clause 5.2 and 5.5.2 for strength and number of suspension provisions. The general requirements of items 4.1.1 to 4.1.8 apply to suspension provisions. (Item 4.1.2 is an Australian supplement.) Note: The definitions of Ultimate Load relative to DLL for this requirement differs to the Annex C Glossary definition. For this item 2.2.13	The project is to request advice from AMTDU for the applicability of this method to the load item requiring certification.	Analysis *or* Test

	requirement, the definition provided at MIL-STD-814D, Clause 5.2.2 applies.		

PART 3 - EXTERNAL LIFT TRANSPORT CERTIFICATION REQUIREMENTS AND VERIFICATION

(a) Table 3 presents instructions and guidance for application of the Aerial Delivery standard for EL transport via rotary wing aircraft. Table 3 makes reference to United States and international standards (as cited by Section 5, Chapter 5, Paragraph 5.5) to establish the requirement with some Australian supplements (as cited by Section 5, Chapter 5, Paragraph 5.6). The Australian Air Publications are used for design data. Where the international standards refer to U.S. Army Soldier Systems Center, AMTDU is the applicable agency.

(b) The following standards and publications contain the relevant requirements and design data, and is to be read in conjunction with this part:

(c) **Adopted Standards (as cited by Section 5, Chapter 5, Paragraph 5)**

1. MIL-STD-913A – Requirements for the Certification of Sling Loaded Military Equipment for External Transportation

2. USA ARMDL Technical Report 72-36 Design Guide for Load Suspension Points, Slings and Aircraft Hard Points (July 1972)

3. AFIC AIR STD AM 4076 Technical Criteria for the Transport of Cargo by Helicopter

Design Data

4. AAP7210.021-9-4 Helicopter External Load Rigging Procedures.

(d) Due to the nature of certification for EL, the application of the standard is not straightforward and some interpretation of the requirements in Table 3 will inevitably be required. Consequently, design organisations will need to seek advice from AMTDU. Where such advice is required, this is identified in the guidance column.

Table 3 – External Lift Transport Certification Requirements and Verification

Item	Instruction for Application of Standard	Guidance	Verification
Load Item Lifting Provisions			
3.1.1	Number Refer to MIL-STD-209K, Section 5, Clause 5.1.1.	Load items that meet this requirement allows compatibility with current Aerial Delivery Equipment used for EL.	Inspection
3.1.2	Location Refer to MIL-STD-209K, Section 5, Clause 5.1.2.	Load items that meet this requirement will promote load stability and allows compatibility with	Analysis *or* Test

Superseded

	Lifting Provisions should be reasonably symmetrical about the longitudinal and lateral axes passing through the load item's Centre of Gravity (or Centre of Gravity range) as determined in its air transport configuration(s) noting that the requirement from 3.3.2 is to also be met.	current Aerial Delivery Equipment used for EL. Advice for dual point lift configurations, where deemed appropriate, should be sought from AMTDU on a case by case basis.	
3.1.3	Strength Lifting Provisions, load spreading devices (including those subject to compressive loads), interference points, connecting equipment structure and any load bearing components are to have sufficient strength to withstand the Helicopter Sling Load (HSL) design limit load (DLL) applied to the lifting provisions. The above listed components are to be capable of sustaining an ultimate load of not less than 1.5 times the HSL DLL. The HSL DLL is to be determined using the worst case loading condition which is defined by the largest product of the HSL materiel lift point load factor (determined IAW Appendix A of MIL-STD-209K) and sling leg tension. i. Single Point Slinging Configurations: In the early stages of load item design, where the sling configuration is not fully defined, the HSL DLL is to be determined IAW MIL-STD-209K Appendix B applied at all angles within the range defined in Figure 3-1 below (Australian Supplement). ii. Dual Point Slinging Configurations: In the early stages of load item design, where the sling configuration is not fully defined, the minimum strength of each Lifting Provision is to be at least equal to 30 percent of the total air transport weight multiplied by the HSL materiel lift point load factor. This force is to be applied at all angles within the range defined in Figure 3-2 below (Australian Supplement).	The project is to request advice from AMTDU if a dual point slinging configuration must be employed. Compliance to this requirement can only be fully achieved after consultation with AMTDU for an assessment of a suitable proposed slinging configuration. The load item weight used for analysis may be defined by an air transport weight in place of the GVM/ Gross Weight. This configuration will need to be carefully considered and communicated to AMTDU. The worst case loading condition is the combination of material lift point load factor and air transport weight that produces the greatest HSL DLL. The worst case loading condition might *not* occur at the maximum air transport weight and consideration should be given to this to	Analysis *and* Test

Superseded

	iii. All Slinging Configurations: Once the slinging configuration is defined by AMTDU, the HSL DLL is to be determined using the sling leg tension obtained from the simulated trial (conducted as per Item 3.3.3). Note that the general requirements from items 4.1.1 to 4.1.8 apply to lifting provisions. (Item 4.1.2 is an Australian Supplement)	determine the HSL DLL. The load item air transport configuration(s) and CoG envelope should be determined prior to any analysis being carried out on the lift points. A shift in CoG position will affect the distribution of loads between sling legs. Changes to CoG location after the air transport configuration is provided to AMTDU is to be avoided as they may invalidate AMTDU load certification activities being conducted for the load item. Further, when defining an air transport configuration for the vehicle, the aircraft limitations (such as lifting capacity and payload/range) is to be considered. Where strength is determined by analysis, appropriate design factors are to be applied. For welded structures this is to include a weld capacity reduction factor as per Australian Standard AS4100 or equivalent international welding standards. Reduction and fitting factors for fasteners are to be used where applicable.	

Superseded

		Any structure where there are abrupt changes in geometry is to make allowance for appropriate stress concentration factors in the analysis.	

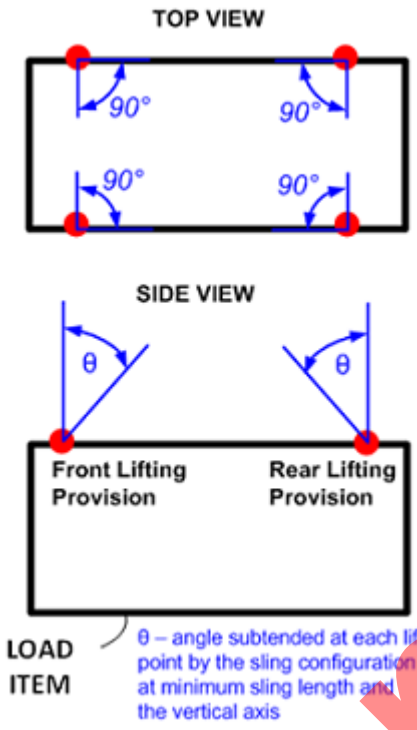

Figure 3-1 – Required angle range for the HSL DLL for single point lifting configuration

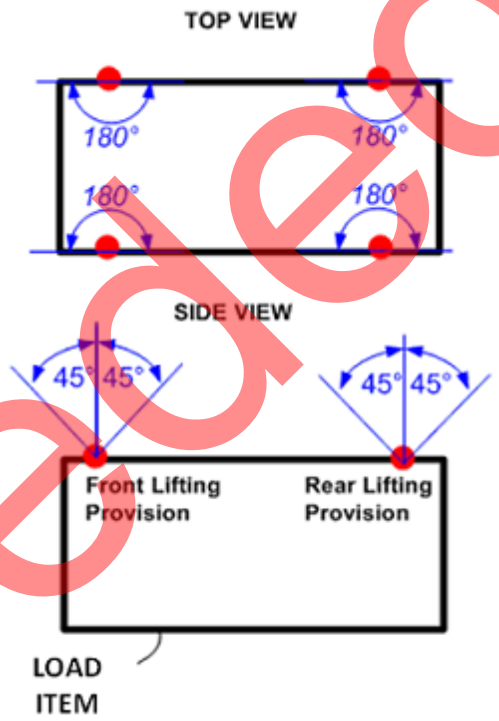

Figure 3-2 – Required angle range for the HSL DLL for dual point lifting configuration

3.1.4	Dimensions Refer to MIL-STD-209K, Section 4, Clause 4.11.	No guarantee of provision strength results from conformity to this requirement (see Item 3.1.3 for strength requirement).	Inspection
3.1.5	Frame Members Refer to MIL-STD-913A, Section 4, Clause 4.1.4 noting that Items 3.1.1 – 3.1.4 apply to frame members (Item 3.1.3 is an Australian Supplement).	See glossary for a definition of Frame Members.	See 3.1.1 – 3.1.4 *(i)* Inspection *(ii)*
3.1.6	Spreader Bars Where spreader bars are approved for use, refer to MIL-STD-913A, Section 4, Clause 4.1.5.	Spreader bars are considered a deviation and AMTDU is to be consulted if their use is	Inspection *and*

Superseded

	Spreader bars or cable guides are to be used during sling configuration testing and are to withstand all sling leg forces imposed noting the ultimate load requirement from Item 3.1.3 also applies. (Item 3.1.3 is an Australian Supplement)	intended for EL of load items. Where used, it is strongly advised that spreader bars be part of the complete equipment schedule Spreader bars are means for altering the sling leg angles to achieve the minimum sling leg clearance specified at Item 3.2.1. Designers should consider using cable guides or reinforcement of sling contact points on the load item as an alternative to requiring spreader bars. Cable guides may be used as an alternative to spreader bars. Refer to Item 3.1.4 for appropriate minimum diameter (D_{min}) dimension of cable guide openings for sling compatibility.	Analysis *or* Test
3.1.7	Applicability of General Requirements The general requirements detailed under items 4.1.1 to 4.1.8 apply to Lifting Provisions. (Item 4.1.2 is an Australian Supplement)	See guidance for items 4.1.1 to 4.1.8.	See items 4.1.1 to 4.1.8
Load Item Physical Properties			
3.2.1	Load Item Basic Data The load item designer or Project office is to provide the following Basic Data for the load item as listed by USA ARMDL Technical Report TR 72-36 (Jul 72), Page 1 (republished as follows):	The load item designer should endeavour to position the load item centre of gravity forward of its centre of pressure. The desired centre of gravity position should be a	Inspection

Superseded

	i. Weight and centre of gravity location (or range) in the air transport configuration(s). ii. Information relating to the outline and external shape. iii. Information relating to the location and strength of substructure.	point at which not more than one third of the total surface area is located forward of the centre of gravity. This greatly improves the likelihood of achieving stability during EL. Methods to alter the Centre of Gravity and centre of pressure are available in AMTDU EL designs; however, these methods are not to be relied upon due to significant operational implications. The asymmetry ratio (Item 3.3.2) is to be considered in conjunction with this requirement as it may constrain the centre of gravity position relative to the centre of pressure.	
Requirements for Sling Configuration			
3.3.1	Minimum Sling Leg Clearance Refer to MIL-STD-913A, Section 4, Clause 4.2.2. This clause applies to all sling types including textile/webbing slings and chain leg slings.	To define a lifting configuration, at a minimum, the following are to be specified: i. How the load is suspended from the aircraft hook/s (single point/ dual point/ tandem) ii. Number of sling legs iii. Individual sling leg lengths	Inspection *or* Demonstration

Superseded

3.3.2	Asymmetry of Lifting Provisions The ratio of the largest vertical sling force to the smallest vertical sling force is not to exceed 1.2 (requirement republished from USA ARMDL Technical Report TR 72-36 (Jul 72), Pages 2 and 21)	iv. Load item air transport configuration(s) and weight (or weight range) v. Load item Maximum Projected Frontal Area. Part of determining a suitable sling configuration initially involves selection of single point, dual point or tandem lifting configurations. Single point lift with four lifting provisions is typically adopted for most EL load items. If dual or tandem lifting configurations are being sought, AMTDU is to be contacted in the first instance.	Analysis *or* Test
3.3.3	Simulated Trial – External Lift (Static Lift Testing) Static lift testing for each proposed lifting configuration is to meet the requirements of MIL-STD-913A, Section 5, Clause 5.1 with the following exception: i. Strength limits for EL ADE used by the ADF apply in lieu of Table I of MIL-STD-913A. This information can be obtained from AAP7210.021-9-4.	AMTDU is responsible for certifying the compliance of a load item in its EL configuration to this requirement. Nonetheless, this requirement should be considered during load item design to facilitate successful EL certification of the load item.	Analysis *and* Test
3.3.4	Load in-flight stability The load item is to be lifted in-flight beneath applicable rotary wing aircraft in its proposed air	Consideration is to be given to test the worst case air transport configuration(s).	Test

Superseded

This can include (but is not limited to) cargo carried by vehicle/trailers, internal cargo within a containing device, purpose built mission modules and integral items such as jerry cans, fire extinguishers spare wheels carried using purpose built provisions.</td><td>Analysis</td></tr>
</table>

Superseded

	Above factors are used to determine limit loads. The load item is not to exhibit permanent deformation upon application of these factors. The load item is to be capable of sustaining an ultimate load of not less than 1.5 times the DLL. Loose items of low mass (an individual item weighing less than 50lb) are not subject to the above restraint requirement, however, are to be securely restrained to prevent them from becoming a hazard. Where secondary cargo restrained using lashings, refer to Item 1.4.3 for determining the available restraint.		

PART 4 – GENERAL REQUIREMENTS - ATTACHMENT POINTS, LIFTING PROVISIONS AND SECONDARY CARGO TIE DOWN PROVISIONS (AL, AD & EL)

(a) Table 4 presents instructions and guidance for application of the Aerial Delivery standard for attachment points, lifting provisions and/or secondary cargo tie down provisions fitted to a load item to be certified for AL, AD and/or EL. Table 4 makes reference to the adopted United States standard (as cited by Section 5, Chapter 5, Paragraph 5.5) to establish the requirement and also contains Australian supplements (as cited bySection 5, Chapter 5, Paragraph 5.6). Where the international standards refer to a US agency (such as Air Transport Test Loading Activity, U.S. Army Soldier Systems Center, US Army SDDCTEA), AMTDU is the applicable agency

(b) The requirements in referenced by this part are military unique interface requirements developed specifically for ensuring that the attachment points and/or lifting provisions on military equipment (load items) meet the physical, functional and operational environment attributes for ADF aircraft.

(c) The US Standard, MIL-STD-209K Lifting and Tie-Down Provisions, contains the relevant requirements and is to be read in conjunction with this part.

Table 4 – Attachment Points, Lifting Provisions and, Secondary Cargo Tie Down Provisions Certification Requirements and Verification

Item	Requirement	Guidance	Verification
General			
4.1.1	Surface of Provisions Refer to MIL-STD-209K, Section 4, Clause 4.2.	Load items meeting this requirement allow compatibility with current Aerial Delivery Equipment.	Inspection

Superseded

Item	Requirement	Guidance	Verification
4.1.2	Shackles Refer to MIL-STD-209K, Section 4, Clause 4.3 with the following additions: i. The strength of the shackle is to be at least equal to the strength of the attachment point, lifting provision or secondary cargo tie down provision which the shackle is used in conjunction with. This includes any applicable ultimate load considerations. (Australian Supplement) ii. Where a shackle must be fitted to an attachment point, lifting provision or secondary cargo tie down provision, any strength qualification of the provision or restraint pattern developed is to include the change in geometry resulting from the use of the shackle. (Australian Supplement)	This requirement simplifies the air transport configuration of the load item by ensuring shackles always remain with the load item being transported.	Analysis *or* Test
4.1.3	Hub and Axle Requirements The use of wheel hubs and axles for restraint are prohibited IAW the requirements of MIL-STD-209K, Section 4, Clause 4.4.	Wheel hubs and axles are considered primary structure but this does not guarantee their suitability for lifting or restraint. Designers are to always install designated attachment points and/or lifting provisions to load items.	Inspection
4.1.4	Removable Provisions Removable attachment points and lifting provisions are prohibited IAW the requirements of MIL-STD-209K, Section 4, Clause 4.5.	Load items meeting these requirements simplify and ensures consistency of the air transport configuration of the load item. AMTDU is to be consulted if these requirements cannot be met.	Inspection
4.1.5	Freezing and Jamming Refer to MIL-STD-209K, Section 4, Clause 4.6.		Inspection *or* Demonstration

Superseded

Item	Requirement	Guidance	Verification
4.1.6	Stowable Lifting Provisions Where the load item contains stowable lifting provisions, refer to MIL-STD-209K, Clause 4.7.		Demonstration
4.1.7	Provision Dimensions Refer to MIL-STD-209K, Section 4, Clause 4.11. The option presented by MIL-STD-209K, Clause 5.2.3.1 may be utilised for load items weighing 50,000lb or more. If used, refer to MIL-STD-209K, Clause 5.2.4.	Load items meeting this requirement allow compatibility with current Aerial Delivery Equipment. There is **no** guarantee of provision strength that results from conformance to this requirement. Refer to strength requirements for each attachment point or lifting provision.	Inspection
4.1.8	Marking/Identification The load item is to be furnished with a shipping data plate as per MIL-STD-209K, Clause 5.7.1. At a minimum, the shipping data plate is to provide the: i. Proper Shipping Name ii. NSN iii. Overall Length iv. Tyre Pressure (or allowable range) v. Maximum Gross and Unladen Weights (for wheeled vehicles, this is to be identified as individual axle weights) vi. Identification of Attachment Points and /or Lifting Provisions (including their strength and allowable pull angles)		Inspection

Superseded

Item	Requirement	Guidance	Verification
	vii. Centre of Gravity or Centre of Gravity Envelope (essential for tracked vehicles) All attachment points and lifting provisions are to be identified as per MIL-STD-209K, Clause 5.7.2. The shipping data plate is to be updated to incorporate configuration changes made to the load item.		
Secondary Cargo Tie down Provisions - The requirements listed under this clause are applicable to load items with a designated cargo area. Note: the requirements listed below are applicable only to 'secondary cargo tie down provisions' which are not included under 'attachment points' (see the Annex C Glossary for further clarification).			
4.2.1	Number Refer to MIL-STD-209K, Clause 5.4.1.	The intent of this requirement is to ensure that all payloads are restrained to the required inflight load or restraint factors. The following calculation is recommended to determine if sufficient cargo tie down provisions exist for the load item payload mass to be adequately restrained. The value determined is rounded up to the nearest even number: $N_{\min} = \frac{M*(G_{fwd}+G_{aft})}{R*0.75}$ Where this formula results in a value less than four, the minimum number of cargo tie down provisions is four. N_{min} – Minimum number of cargo tie down provisions	Analysis

Superseded

Item	Requirement	Guidance	Verification
		M – Load item mass in air transport configuration G_{fwd}, G_{af} – The applicable restraint load factor in the forward and aft directions (items 1.4.1 or 2.2.9) *R* – Strength Rating of attachment point as per Item 4.2.3	
4.2.2	Location Refer to MIL-STD-209K, Clause 5.4.2.	Secondary Cargo tie down provisions are to be positioned symmetrically around the cargo area, such that cargo can be restrained to satisfy Items 1.4.1 (AL), 2.2.9 (AD), or 3.4.1 (EL) as applicable to the required transport method. Secondary cargo tie down provisions are usually best positioned around the perimeter of the cargo area. The designer is to consider the intended use of the cargo area and types of cargo in the air transport configuration when deciding on the provision location, as this may dictate that provisions be placed in other locations (e.g. centreline, gird pattern, column arrangement).	Inspection
4.2.3	Strength Refer to MIL-STD-209K, Clause 5.4.3 for the strength of secondary cargo tie down provisions. For AL load items, the strength rating is to consider yield and ultimate factors		Analysis *or* Test

Superseded

Item	Requirement	Guidance	Verification
	consistent with the requirements of Item 1.4.1. For AD and EL load items, the strength rating is the allowable Design Limit Load. In addition secondary cargo tie down provisions are to be capable of sustaining an ultimate load of not less than 1.5 times the Design Limit Load. (Australian Supplement – AD only).		
4.2.4	Dimensions Refer to MIL-STD-209K, Clause 5.4.4 for the dimensions of secondary cargo tie down provisions. For cargo areas with a capacity greater than 5000lb, refer to MIL-STD-209K, Clause 5.5.4.	A load item that meets this requirement enables compatibility with current Aerial Delivery Equipment. There is no guarantee of provision strength that results from conformance to this requirement. See Item 4.2.3 for the strength requirement of secondary cargo tie down provisions.	Inspection
4.2.5	Directional Capabilities Refer to MIL-STD-209K, Clause 5.4.6 for the directional capabilities of secondary cargo tie down provisions.		Inspection

Superseded

PART 5 – DETAILED REQUIREMENTS – ATTACHMENT POINTS (AL & AD)

(a) Table 5 presents instructions and guidance for application of the Aerial Delivery standard for attachment points fitted to a load item to be certified for AL and AD. Table 5 makes reference to a United States standard (as cited by Section 5, Chapter 5, Paragraph 5.5) to establish the requirement and also contains Australian supplements (as cited bySection 5, Chapter 5, Paragraph 5.6). Where the international standards refer to a US agency (such as Air Transport Test Loading Activity, U.S. Army Soldier Systems Center, US Army SDDCTEA), AMTDU is the applicable agency

(b) US standards use the terms ‘tie down provisions’ and ‘supplementary tie down’ provisions. This Annex does not differentiate between the two terms and uses the term ‘Attachment Point’ to include both ‘tie down provisions’ and ‘supplementary tie down’ provisions. See the Annex C Glossary for a definition of all terms.

(c) The US Standard, MIL-STD-209K Lifting and Tie-Down Provisions, contains the relevant requirements and is to be read in conjunction with this part.

Table 5 – Attachment Points Certification Requirements and Verification

Item	Requirement	Guidance	Verification
5.1.1	Restraint of Item Refer to MIL-STD-209K, Clause 4.1.		Inspection
5.1.2	Number (Australian Supplement) The minimum number of attachment points fitted to the load item is to conform to the value determined by the formula below. The value determined is rounded up to the nearest even number: $$N_{\min} = \frac{M*(G_{fwd} + G_{aft})}{R*0.75}$$ Where this formula results in a value less than four, the minimum number of attachment points is four. N_{min} – Minimum number of attachment points M – Load item mass in air transport configuration G_{fwd}, Ga_{ft} – The applicable restraint load factor in the forward and aft directions (items 1.4.1 or 2.2.9) R – Strength Rating of attachment point as per Item 5.1.3	Load items meeting this requirement allow for the successful design of a restraint pattern for AL and/ or AD modes of transport.	Analysis
5.1.3	Strength Rating (Australian Supplement) The magnitude of the strength rating of the attachment points is to be 5000lbf (applicable to AL only), 6000lbf (applicable to AD only), 10,000lbf, 20,000lbf, 25,000lbf **or** 50 000lbf (AL & AD). **For AL load items**, the strength rating is to consider yield and ultimate factors	The listed rating magnitudes are determined from the rated strengths of the types of lashings used on board ADF aircraft. AMTDU is to be consulted if the selected attachment point rating value varies from the provided values.	Analysis *or* Test

Superseded

ANNEX B - AERIAL DELIVERY VERIFICATION METHODS

AERIAL DELIVERY VERIFICATION METHODS

Inspection is the non-destructive examination of a product or system. It may include simple physical manipulation and measurements. This is generally used to verify physical design features.

Analysis is the use of mathematical modelling and analytical techniques to predict the compliance of a design to its requirements based on calculated data or data derived from system or subsystem testing.

Demonstration is the use of component, subsystem, or system operation to show that a requirement can be achieved by the system. It is generally used for a basic confirmation of performance capability and is differentiated from testing by the lack of detailed data gathering. Often, other verification methods will be used in support of demonstration.

Test is the use of component, subsystem, or system operation to obtain detailed data to verify performance or to provide sufficient information to verify performance through further analysis.

GLOSSARY

463L – The common designation for a family of air cargo handling equipment. The 463L system consists of separate, but interdependent, equipment families, including terminals, on-board aircraft cargo handling systems, ground handling equipment, pallets and nets. The pallets with nets are used as an unitisation module and are loaded into the aircraft on roller conveyors. A 463L equipped aircraft has roller conveyor assemblies and restraint rails with integral locks. A pallet/net assembly is secured into the aircraft by these locks. [AL]

Aerial Delivery – The act or process of delivering cargo by air transport, air drop or external lift. [General]

Air drop – Delivery of personnel or cargo from aircraft in flight. There are four current methods of air drop: free drop, low velocity drop, high velocity drop and precision air drop. [AD]

Air Land Transport – Delivery of personnel or cargo from point to point in which the cargo is delivered by air landing. [AL]

Air Land Trial (Load Trial) – A trial evaluating loading of an item(s) to an aircraft (or simulated aircraft) for air transportability certification. Test loadings are normally limited to cases where the characteristics of items are such that analytical means alone are judged insufficient to determine an item's air transport eligibility. Because of the expense and work effort involved, test loadings are normally only performed only with recommendation, approval and support of AMTDU. Generally test loadings require the development and documentation of special procedures for handling and/or restraint. [AL]

Air Transport (Air Land Transport) – The airborne delivery of personnel or cargo from Air Land location to Air Land location by aircraft. [AL]

Air Transport Weight – The weight of the load item in the configuration that it is to be air transported in.

Attachment Points – An integral part of an item, tie down eye, fixture, or attachment for which serves as the primary means of connecting a lashing to the primary load item for restraint purposes during shipment. Attachment points are also referred to as 'tie down provisions', 'supplementary tie down provisions' or 'tie-down points' in foreign country standards. [General]

Design Limit Load (Limit Load) – The applied force, or maximum probable force, that a lifting or restraint point, including its connecting structural members, is to be able to withstand without permanent deformation occurring. The design limit load is to be used for proof load analysis. [General]

Design Proof Load – The maximum load that a structure is designed to withstand without deformation. It is the product of the design limit load and the proof factor. A proof factor is not typically applied in this standard and is therefore equal to 1.0. [General]

Design Ultimate Load (Ultimate Load, Ultimate Strength) – The force that a provision, including its connecting structural members, can sustain without breaking, rupturing, or otherwise becoming unusable. The DUL is used in the design/testing context. [General]

Superseded

Dual Point External Load – A single load Item which is simultaneously suspended from two aircraft cargo hooks. [EL]

Energy Dissipater – A device used for absorbing or dissipating the kinetic energy experienced by an air drop load during impact. [AD]

Energy Dissipating Material - As used in this standard, a crushable material (paper honeycomb) used to dissipate kinetic energy during impact. This material is to conform to MIL-H-9884. [AD]

External Lift Live Trial (External Lift Flight Test) – A flight trial in which a load item is rigged in its External Air Transport configuration and flown through specific aerial manoeuvres by ADF rotary wing aircraft in order to determine external air transport suitability. This test is used to verify stability during flight; as well as indicating the load item can withstand the dynamic forces induced by transportation by air. [EL]

External Lift Simulated Trial (Simulated Lift Test – External Lift) – A test where the rigged item is lifted by crane or hoist in order to verify the proposed rigging configuration and determine associated sling forces, as well as identify clearance problems. This is also referred to as a 'static lift test' by US MIL-STDs. [EL]

Extracted Weight – The total weight of the air drop item plus the weight of all items of air drop equipment required to rig and deliver the air dropped load including the parachute. [AD]

Extraction Provisions – An integral fitting on the load item used for attaching the extraction system for air drop applications. The preference is for the extraction provision on the Type V air drop platform to be used. This is defined as a platform extracted load. [AD]

Frame Members (Primary Structure) - Key structural components of a load item (e.g. main chassis beams, cross members) specifically designed to carry the main forces applied to the load item during its operation (such as weight, driving loads, operating loads, working loads). [General]

General Cargo – Cargo without special or hazardous properties that does not require extra precautions or special handling for air transport and does not exceed published aircraft limits. [AL]

Hazardous Materials – A substance or materiel which has been determined and designated by the IATA Dangerous Goods Regulations and/or the AAP 3631.002

Dangerous Goods – Transport by Service Air to be capable of posing an unreasonable risk to health, safety, and property when transported. Included are explosives, articles such as flammable liquids and solids and other dangerous oxidizing materials, corrosive materials, compressed gases, poisons and irritating materials, etiologic agents and radioactive materials. [General]

Lifting Provisions – An integral part of the load item, commonly called a padeye, lug, eye, ring, or attachment. A lifting provision provides a means of attaching a sling to the load item for safe lifting. [EL]

Load Item Designer – The party responsible for design of the military equipment (the load item) for delivery to the CoA.

Multi Point External Load – Two or more load items, suspended individually from separate aircraft cargo hooks. [EL]

Multipurpose Provision – A single provision that meets the requirements of this standard for both lifting and load item tie down. [General]

Superseded

Pallet – A simple unit load device used for consolidation of cargo for efficient handling. Within the RAAF, pallets fall into the following basic groups. [AL]

(a) **Warehouse Pallet:** Generally a wood pallet 40 inches x 48 inches x 6 inches, weighing 75 to 100 lb.

(b) **463L HCU-6E Pallet:** The pallet used within the military air cargo handling system and is also compatible with commercial air cargo systems. (104 in length x 84 in width x variable height. Height is determined by aircraft type)

(c) **463L HCU-12/E Pallet:** A pallet used within the military cargo handling system (88 in length x 54 in width x 76 in height).

Permanent Deformation – Any visible permanent irreversible change in the original dimensions or shape of the provision or connecting structure resulting from an applied force. [General]

Rigged Configuration – The completed load as presented to the aircraft ready for air drop. [AD]

Secondary Cargo Tie down Provision – A padeye, ring, shackle, fixture, or attachment integral to the cargo areas of trucks and trailers, flatbed trailers, or flat-racks (used as a demountable truck or trailer bed for securing secondary cargo or accessories). This is referred to as 'cargo tie down provisions' or 'large cargo tie down provisions' in US MIL-STDs. [General]

Shoring – Material, typically timber, used as a loading or transport aid. Both plywood and dimension lumber are commonly used for shoring purposes. Shoring includes:

(a) **Approach Shoring (Step-Up Shoring):** Approach shoring is used to reduce the ramp angle that a vehicle must traverse during aircraft on/offloading. Reduction of the ramp angle becomes necessary to avoid interference problems where there are minimal underside, overhead, or overhang clearances. Approach shoring requires large amounts of lumber and is not a preferred alternative to designing to have adequate clearances. [AL]

(b) **Parking shoring:** Shoring that is required under the wheels or tracks of vehicular cargo to distribute loads for inflight conditions. [AL]

(c) **Roller Shoring:** Shoring that is required to protect the aircraft ramps and cargo compartment floor from damage during on/ offloading and flight of tracked vehicles or vehicles with wheels that have lugs, cleats studs, metal rolling surfaces or small diameters. [AL]

(d) **Sleeper Shoring:** Sleeper shoring is used to prevent the movement of a vehicle due to gust and flight manoeuvre load conditions where tyres or the suspension system cannot withstand these loads without failure or depression producing slack in lashings. This type of shoring is placed between the aircraft floor and a structural part of the vehicle such as the frame. [AL]

Single Point External Load – A single load item which is suspended from one aircraft cargo hook. [EL]

Suspended Item – The rigged item suspended without the recovery parachute system attached. [AD]

Suspended Weight – The extracted weight less the weight of the parachute system. [AD]

Suspension Provision – An integral fitting on the load item or the air drop platform used to attach the suspension system and the retardation parachute system. The suspension system may also include the parachute release. [AD]

Superseded

Tandem Load – A load consisting of two separate load items, which are connected or prepared together in tandem. An example of a tandem load is a vehicle and trailer combination. Tandem loads are typically prepared and transported via a Dual Point Sling Load method. [EL]

Tie down Devices and Lashings – Chain or strap with integral attaching hardware used to restrain load items by means of connection between the load item attachment point and the platform or aircraft floor Tie down fitting. [AL, AD]

Tie down Fitting (Floor Ring) – Ring type cargo restraint fittings which are part of the aircraft floor. [AL]

Treadways – This is strengthened area of the cargo compartment floor especially designed to support vehicle traffic in C130/C-27 and CH-47 aircraft. [AL]

Ultimate Load Factor – A factor applied to the DLL to obtain the DUL. The ultimate load factor is equal to 1.5. [General]

Working Limit Load (Safe Working Load, Working Load) – The maximum load that can be applied to a device in the operational context. This load is inclusive of the relevant safety, flight load, material or other design factors. This is the 'rating' provided to operational users of the load item. [General]

Yield Load – The force at which a provision, including its connecting structural members, exhibits permanent deformation after the force is removed. The yield load must be greater than the design limit load. [General]

Superseded

ROLE EQUIPMENT AND PORTABLE ELECTRONIC EQUIPMENT

Superseded

INTRODUCTION

6.1 Role equipment and Portable Electronic Equipment (PEE) are managed under DASR ORO.75 Use of Aircraft Role Equipment, and DASR ORO.65 Carriage and Use of Portable Electronic Equipment respectively. Role equipment is any equipment, apart from Aeronautical Life Support Equipment (ALSE), fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission. Portable Electronic Equipment (PEE) (also known as Portable Electronic Devices or PEDs) comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, role equipment or ALSE.

6.2 Role equipment and PEE may compromise aircraft safe flight, occupant safety or capability. Consequently, technical evaluation of the equipment to identify, evaluate and minimise potential hazards is warranted. A secondary, but nevertheless important, aspect of the technical evaluation is to confirm that the equipment can operate and perform its intended function without being adversely affected by the aircraft operating environment.

Scope

6.3 This chapter presents the Authority prescribed design requirements for role equipment. The chapter also presents guidance on the technical evaluation of role equipment and PEE to support operational commander decisions on approvals, where required. Finally, the chapter presents a number of capability design requirements for establishing whether the role equipment or PEE will function as intended when exposed to an aircraft operating environment.

ROLE EQUIPMENT AND PEE DESIGN REQUIREMENTS

6.4 Given the different hazard context associated with Certified and Specific Approval role equipment, and PEE, the following paragraphs present the Authority prescribed airworthiness design requirements for each of these types of equipment as separate, but interlinked, requirements suites.

ROLE EQUIPMENT

6.5 DASR GM ORO.75 identifies two discrete categories of role equipment, being: ‘Certified’ and ‘Specific Approval’. Each of these categories is subject to a different management framework for approving the equipment for use on Defence aircraft. The application of the design requirements in this chapter is aligned to these categories and approval approaches.

6.6 Where role equipment is categorised as Certified, the equipment is included within the aircraft's type design and is therefore subject to DASR 21 certification requirements. All Certified category role equipment must therefore satisfy the applicable airworthiness design requirements in the host aircraft's Type Certification basis (TCB).

6.7 **Design Requirement (Essential).** *Certified category role equipment must meet the applicable airworthiness design requirements prescribed in the host aircraft's TCB.*

6.8 Compliance with the design requirements in a host aircraft's TCB demonstrates that the equipment can be safely operated in the aircraft. Where Certified category role equipment includes design characteristics that are not included in the host aircraft's TCB, the TCB must be supplemented with applicable design requirements. The design requirements for Specific Approval role equipment in this chapter provide guidance in establishing these additional requirements. This includes the conduct of a system safety analysis to identify and manage any novel hazards introduced by the role equipment.

Specific Approval category role equipment design requirements

6.9 Role equipment that is categorised as Specific Approval is not included in the aircraft's type design; rather the relevant operational commander approves its use (DASR ORO.75 refers). Specific Approval role equipment is usually associated with equipment that is introduced as a result of a capability imperative, where the pursuit of 'certification' would either adversely impact the capability outcome or is not warranted given the impact of the role equipment on aircraft and occupant safety. Nevertheless, Specific Approval category role equipment may pose hazards to aircraft safe flight, occupants or capability. Consequently, to support the operational commander in making an informed decision on role equipment approval, a technical evaluation of the associated hazards and potential risk controls is required by DASR ORO.75. This technical evaluation should include the following:

(a) potential hazards that the role equipment may pose to either the aircraft or occupants

(b) potential design/engineering controls that could be implemented to treat identified hazards

(c) requirements for the operation, installation, maintenance and support of the role equipment

(d) potential capability impacts resulting from role equipment use during aircraft operations.

6.10 While role equipment may initially be categorised as Specific Approval, to support an operational imperative, role equipment should be considered for certification where reasonably practicable. In particular, where the equipment is proposed for long-term use or use on multiple aircraft types, certification will ensure that all hazards are identified and analysed using a robust technical assessment framework to eliminate or otherwise minimise associated risks.

6.11 Unlike most other design requirements in the DASDRM, the following role equipment design requirements are not prescribed by the Authority since Specific Approval role equipment is not subject to certification processes. However, the requirements in this section provide a sound basis for undertaking Specific Approval role equipment technical evaluations, and should be considered when developing the 'technical advice' required by ORO.75. Further guidance on the application of the following design requirements is presented in Annex A.

Superseded

6.12 **Design Requirement.** *Role equipment should be subjected to a system safety analysis conducted in accordance with the requirements of Section 2 Chapter 2.*

6.13 While role equipment design requirements prescribed in this Chapter provide a basis for establishing that the equipment can be safely operated in a host aircraft, role equipment may introduce other hazards that are not identified through compliance with these requirements. Consequently, prior to role equipment approval for use on the host aircraft, a system safety analysis should be conducted to identify hazards and inform decisions on risk treatment.

6.14 **Design Requirement.** *Where role equipment exposure to aircraft operating environments may result in failure modes that pose a hazard to the host aircraft, the role equipment should satisfy the relevant equipment environmental qualification standards prescribed in the aircraft certification basis.*

6.15 Aircraft can present a harsh environment for role equipment, and inadequately designed equipment may present a hazard to the host aircraft. For example, explosive or rapid aircraft decompression may lead to the role equipment exploding if there is no pressure relief for sealed components, while aircraft vibration may cause internal short-circuits that generate sparks or fumes. Consequently, the role equipment should be verified to withstand the environmental conditions defined in the host aircraft's certification basis without posing a hazard to the host aircraft. Where the host aircraft certification basis for environmental qualification is uncertain, the requirements in Section 2 Chapter 9, Equipment Environmental Qualification, provide an initial benchmark for role equipment evaluation.

6.16 **Design Requirement.** *Role equipment should satisfy the relevant airworthiness design requirements for electromagnetic compatibility as prescribed in the aircraft certification basis.*

6.17 Aircraft electrical and electronic systems are designed to satisfy the electromagnetic compatibility requirements prescribed in the aircraft's certification basis. However, role equipment may not be designed to standards that provide a similar level of electromagnetic compatibility with the sometimes sensitive equipment found on aircraft. Consequently, role equipment should be evaluated prior to approval for use, to determine whether the equipment generates conducted or radiated emissions that could result in interference with aircraft systems. Where the host aircraft certification basis for E3 is uncertain, the requirements in Section 2 Chapter 4 provide an initial benchmark for role equipment evaluation.

6.18 **Design Requirement.** *Role equipment should satisfy the relevant airworthiness design requirements for electrical systems as prescribed in the aircraft certification basis.*

6.19 Aircraft electrical and electronic systems are designed to satisfy the electrical system requirements prescribed in the aircraft's certification basis. To ensure role equipment does not pose a hazard to the host aircraft, it should meet similar electrical system design requirements. This includes circuit protection, wire insulation type, battery protection, electrical loading and so on. Where the host aircraft certification basis for electrical systems is uncertain, the requirements in Section 3 Chapter 8 provide an initial benchmark for role equipment evaluation.

6.20 **Design Requirement.** *Role equipment should satisfy the relevant Authority prescribed airworthiness design requirements for oxygen systems detailed in Section 3 Chapter 6 of the DASDRM.*

6.21 Inadequately designed oxygen systems in role equipment may present a fire hazard. Role equipment designs and support systems should be evaluated to confirm that common risk reduction measures, such as filters on oxygen replenishing valves, skilled oxygen system maintainers, periodic servicing and so on are incorporated into the design and associated maintenance practices. Designs compliant with contemporary standards may be more forgiving of shortfalls in these risk reduction

Superseded

measures, due to a 'systems' approach to design that includes fire-resistant materials, filters, pressure reduction and so on.

6.22 **Design Requirement.** *Role equipment should be mounted within the host aircraft so that it will be restrained and retain its physical integrity when subjected to the maximum forces prescribed in the aircraft certification basis for a crash or hard landing.*

6.23 Role equipment may compromise the crash protection features of the host aircraft where it is not designed to, or is not mounted using devices that can, withstand the forces experienced during a crash or hard landing. Consequently, proposed role equipment and installation techniques should be evaluated prior to approval for use, to ensure that the equipment design can be appropriately restrained and can withstand applicable crash or hard landing forces.

6.24 **Design Requirement.** *Role equipment should not pose a personnel hazard, either in flight or during emergency egress.*

6.25 Role equipment designs may introduce physical hazards to on-board personnel that are not present in the 'normal' operational environment of the equipment. For example sharp edges may result in injury when personnel are required to move around the equipment in the confined space of an aircraft cabin, or the equipment may become a snag hazard during aircraft evacuation. Consequently, role equipment should be evaluated prior to approval for use, to ensure that hazards are identified and risks appropriately treated.

6.26 **Continuing airworthiness requirement.** *Where relevant, the responsible CAMO should establish a system for monitoring and managing changes in role equipment configuration, to confirm they continue to be compatible with the host aircraft.*

6.27 **Continuing airworthiness requirement.** *Where degradation of the role equipment may pose a hazard to the host aircraft, CAMOs should establish a maintenance management program for the equipment.*

6.28 While safe operation of role equipment on Defence aircraft will initially be established through the technical evaluation in support of role equipment approval, inadequate maintenance practices or changes in equipment configuration may compromise the level of safety established during this initial evaluation.

PORTABLE ELECTRONIC EQUIPMENT

6.29 Portable Electronic Equipment (PEE) is ubiquitous in modern society and is increasingly being used to support operational capability in Defence. Unlike other types of role equipment, the nature of PEE is such that it (normally) has limited potential for impact on aviation safety. For many common types of PEE, a risk assessment may determine that operational controls are sufficient to minimise the risks associated with PEE use without the need for a robust technical assessment. However, Defence may seek to use PEE that inherently poses unique hazards, such as intentional emitters, or in aircraft that have design features that pose unique hazards for PEE use, such as exposed sensitive equipment and wiring. Under these circumstances, additional technical evaluation of the PEE is warranted, to identify potential hazards and minimise associated risks. This section presents guidance to engineers on the PEE considerations that should be taken into account when providing technical advice to support PEE approvals.

6.30 All PEE approvals should be supported by a technical assessment. The level and scope of assessment required is relative to the impact of the PEE on safe flight and occupant safety, ie the

Superseded

potential hazards that PEE use introduces. Thus, the identification and characterisation of hazards to inform risk management decisions including the implementation of operational controls, is the focus of the technical assessment. To assist engineers to define the scope and level of assessment required, the following potential impacts on safe flight and occupant safety should be considered:

(a) **Safe flight:** Potential EMI/EMC associated with broadband unintentional emissions, or with intentional emissions where the PEE is required to be used as a functional transmitter during flight. Frequency and power of the emissions and the potential for the PEE to be used in close proximity to sensitive electrical/electronic safety of flight systems should be considered. The technical assessment should also consider the effect of limiting use to 'flight mode' or establishing 'safe zones' within the aircraft for transmitting PEE on the hazard.

(b) **Occupant safety:** Possible battery overheat/fire issues (for Li-ion batteries). Electrical overheat or battery fires may generate smoke and fumes and/or lead to cabin fires. Additional hazards associated with the presence of flammable materials (or materials that do not meet common practice aviation flammability requirements) may be present in military aircraft. The impact of such materials on occupant safety, eg the presence of additional/hazardous smoke/ fumes, should be evaluated. Some PEE, for example laptop computers, may require suitable restraint during take-off and landing to avoid the PEE compromising occupant safety during a crash or hard landing.

6.31 Some PEE may have previously been subject to evaluation by operators of civil and military aircraft and approved for use under the applicable operational regulations. For this PEE, such prior approvals may be used to support similar approvals on Defence aircraft, and can limit the technical assessment required, provided that the Defence aircraft CRE is substantially similar to that of the aircraft on which the PEE was previously approved. The following paragraphs present additional guidance material to assist engineers in developing advice to operational commanders to support PEE approvals.

PEE Evaluation

6.32 Major civil NAAs (EASA, FAA and CASA) have issued guidance to civil operators on the approval of PEE for use on aircraft. The following FAA, CASA and EASA documents provide detailed guidance for evaluating PEE for use on aircraft (including intentional emitter PEE) and provide a suitable benchmark for undertaking similar assessments for Defence aircraft:

(a) FAA AC 91.21-1D Use of Portable Electronic Devices Aboard Aircraft, or

(b) CASA Airworthiness Bulletin 23-003 Issue 2 Aid to Operators for the Expanded Use of Passenger PEDs, or

(c) EASA Part-CAT AMC/GM – to CAT.GEN.MPA.140 Portable Electronic Devices.

6.33 PEE 'safe zones'. In addition to the preceding generic PEE evaluation considerations, PEE may incorporate intentional emitters whose emissions may exceed the certified thresholds for aircraft systems interference. However, this PEE may still be operable in Defence aircraft provided that it is located in a region where the emissions do not interfere with safety of flight systems. These regions are known as PEE safe zones. For military aircraft, sensitive system components and wiring may be more accessible to occupants and, therefore, the potential for intentional emitters to adversely affect these systems may be greater than in similar civil aircraft. To permit the operation of this PEE, where relevant, establishing a PEE safe zone may be useful in controlling this potential hazard.

Superseded

6.34 The establishment of a PEE safe zone permits operation of PEE, with only a limited evaluation to confirm that the emissions of the equipment do not exceed the maximum levels associated with the zone. Establishing this zone could reduce the effort required to approve individual PEE for use. Additional guidance on the methodology for establishing PEE safe zones is presented in Annex B.

CAPABILITY DESIGN REQUIREMENTS

6.35 Role equipment and PEE used on Defence aircraft may perform an important capability function. Therefore, the ability of the role equipment or PEE to adequately perform its function while in an aircraft environment should be established before the equipment is approved for use. Role equipment and PEE may also adversely impact mission systems and equipment on the aircraft, causing loss or degradation of capability. Consequently, the Authority has identified capability design requirements to support the identification of capability impacts on the role equipment/PEE and the aircraft.

Impact on role equipment/PEE capability

6.36 Issues associated with electromagnetic compatibility, electrical compatibility, environmental qualification, physical compatibility and useability may all impact the effectiveness of role equipment/PEE when used in a Defence aircraft. The following capability design requirements are not prescribed by the Authority, but should be considered when establishing the suitability of role equipment/PEE for use on Defence aircraft.

6.37 **Capability design requirement.** *Where failure of role equipment or PEE, due to exposure to aircraft environmental conditions, will affect Defence capability, the equipment should be evaluated against the environmental design requirements applicable to the host aircraft.*

6.38 **Capability design requirement**. *Where failure of role equipment or PEE, due to exposure to the aircraft's electromagnetic environment, will affect Defence capability, the equipment should be evaluated against the electromagnetic susceptibility requirements applicable to the host aircraft.*

6.39 Role equipment and PEE may not be designed to withstand the often hostile environmental conditions experienced in the host aircraft. Given that some role equipment/PEE is essential to achieve required capability outcomes (eg aeromedical evacuation equipment, which performs a critical role in patient treatment and survival in an aircraft), ensuring that the equipment can continue to function correctly in an aircraft environment is necessary. Consequently, role equipment/PEE design and proposed installation should be evaluated to ensure that equipment functions will not be adversely affected when subjected to the physical (vibration, temperature, dust/moisture laden environments, noise and so on) and electromagnetic environmental conditions experienced by the host aircraft.

6.40 **Capability design requirement.** *Where role equipment or PEE are to be connected to the aircraft's electrical system, the electrical interface should be evaluated to confirm compatibility with the role equipment or PEE.*

6.41 Physical and functional compatibility with the aircraft's electrical power system should be verified for role equipment and PEE that will require aircraft power to operate correctly. This may require modification of the equipment if aircraft power characteristics (eg voltage and frequency stability, filtering and so on) are inadequate.

6.42 **Capability design requirement.** *For first of type role equipment or PEE, the operator interface should be verified as compatible with the airborne environment.*

Superseded

6.43 The airborne environment presents challenges for the role equipment operator that are not present in a ground environment. Issues such as aircraft movement during turbulence, inadequate lighting, cramped conditions, aircrew gloves and so on, may induce operator error unless human factors considerations are incorporated into the design process.

6.44 **Capability design requirement.** *Role equipment and PEE should be located and fitted to support operation in the host aircraft.*

6.45 Role equipment operators should be consulted to verify that the proposed location and fitment of the equipment in the host aircraft does not unacceptably degrade the operator's ability to use the equipment.

Impact on host aircraft capability

6.46 **Capability design requirement.** *Role equipment should be evaluated to confirm that it does not adversely impact the operation of aircraft mission systems and equipment.*

6.47 Role equipment should be verified to not adversely impact the operation of mission systems and equipment, predominantly through EMI/EMC. Depending on the proposed location of the role equipment or PEE, and whether it is intended to be non-transmitting or transmitting during use, EMI/EMC impacts on sensitive mission systems may occur. The technical evaluation should confirm whether the role equipment/PEE has the potential to degrade mission system functions and provide advice on potential limitations on use that could eliminate or minimise the associated capability impact.

ROLE EQUIPMENT AND PEE DESIGN REQUIREMENTS GUIDANCE

6.48 Further guidance on implementing design requirements for role equipment and PEE can be provided by the chapter sponsor.

INTRODUCTION

ROLE EQUIPMENT AND PORTABLE ELECTRONIC EQUIPMENT

INTRODUCTION

6.1 Role equipment and Portable Electronic Equipment (PEE) are managed under DASR ORO.75 Use of Aircraft Role Equipment, and DASR ORO.65 Carriage and Use of Portable Electronic Equipment respectively. Role equipment is any equipment, apart from Aeronautical Life Support Equipment (ALSE), fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission. Portable Electronic Equipment (PEE) (also known as Portable Electronic Devices or PEDs) comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, role equipment or ALSE.

6.2 Role equipment and PEE may compromise aircraft safe flight, occupant safety or capability. Consequently, technical evaluation of the equipment to identify, evaluate and minimise potential hazards is warranted. A secondary, but nevertheless important, aspect of the technical evaluation is to confirm that the equipment can operate and perform its intended function without being adversely affected by the aircraft operating environment.

Scope

6.3 This chapter presents the Authority prescribed design requirements for role equipment. The chapter also presents guidance on the technical evaluation of role equipment and PEE to support operational commander decisions on approvals, where required. Finally, the chapter presents a number of capability design requirements for establishing whether the role equipment or PEE will function as intended when exposed to an aircraft operating environment.

ROLE EQUIPMENT AND PEE DESIGN REQUIREMENTS

6.4 Given the different hazard context associated with Certified and Specific Approval role equipment, and PEE, the following paragraphs present the Authority prescribed airworthiness design requirements for each of these types of equipment as separate, but interlinked, requirements suites.

ROLE EQUIPMENT

6.5 DASR GM ORO.75 identifies two discrete categories of role equipment, being: ‘Certified’ and ‘Specific Approval’. Each of these categories is subject to a different management framework for approving the equipment for use on Defence aircraft. The application of the design requirements in this chapter is aligned to these categories and approval approaches.

Certified category role equipment design requirements

6.6 Where role equipment is categorised as Certified, the equipment is included within the aircraft’s type design and is therefore subject to DASR 21 certification requirements. All Certified category role equipment must therefore satisfy the applicable airworthiness design requirements in the host aircraft’s Type Certification basis (TCB).

Superseded

6.7 **Design Requirement (Essential).** *Certified category role equipment must meet the applicable airworthiness design requirements prescribed in the host aircraft's TCB.*

6.8 Compliance with the design requirements in a host aircraft's TCB demonstrates that the equipment can be safely operated in the aircraft. Where Certified category role equipment includes design characteristics that are not included in the host aircraft's TCB, the TCB must be supplemented with applicable design requirements. The design requirements for Specific Approval role equipment in this chapter provide guidance in establishing these additional requirements. This includes the conduct of a system safety analysis to identify and manage any novel hazards introduced by the role equipment.

Specific Approval category role equipment design requirements

6.9 Role equipment that is categorised as Specific Approval is not included in the aircraft's type design; rather the relevant operational commander approves its use (DASR ORO.75 refers). Specific Approval role equipment is usually associated with equipment that is introduced as a result of a capability imperative, where the pursuit of 'certification' would either adversely impact the capability outcome or is not warranted given the impact of the role equipment on aircraft and occupant safety. Nevertheless, Specific Approval category role equipment may pose hazards to aircraft safe flight, occupants or capability. Consequently, to support the operational commander in making an informed decision on role equipment approval, a technical evaluation of the associated hazards and potential risk controls is required by DASR ORO.75. This technical evaluation should include the following:

(a) potential hazards that the role equipment may pose to either the aircraft or occupants

(b) potential design/engineering controls that could be implemented to treat identified hazards

(c) requirements for the operation, installation, maintenance and support of the role equipment

(d) potential capability impacts resulting from role equipment use during aircraft operations.

6.10 While role equipment may initially be categorised as Specific Approval, to support an operational imperative, role equipment should be considered for certification where reasonably practicable. In particular, where the equipment is proposed for long-term use or use on multiple aircraft types, certification will ensure that all hazards are identified and analysed using a robust technical assessment framework to eliminate or otherwise minimise associated risks.

6.11 Unlike most other design requirements in the DASDRM, the following role equipment design requirements are not prescribed by the Authority since Specific Approval role equipment is not subject to certification processes. However, the requirements in this section provide a sound basis for undertaking Specific Approval role equipment technical evaluations, and should be considered when developing the 'technical advice' required by ORO.75. Further guidance on the application of the following design requirements is presented in Annex A.

6.12 **Design Requirement.** *Role equipment should be subjected to a system safety analysis conducted in accordance with the requirements of Section 2 Chapter 2.*

6.13 While role equipment design requirements prescribed in this Chapter provide a basis for establishing that the equipment can be safely operated in a host aircraft, role equipment may introduce other hazards that are not identified through compliance with these requirements. Consequently, prior to role equipment approval for use on the host aircraft, a system safety analysis should be conducted to identify hazards and inform decisions on risk treatment.

Superseded

6.14 **Design Requirement.** *Where role equipment exposure to aircraft operating environments may result in failure modes that pose a hazard to the host aircraft, the role equipment should satisfy the relevant equipment environmental qualification standards prescribed in the aircraft certification basis.*

6.15 Aircraft can present a harsh environment for role equipment, and inadequately designed equipment may present a hazard to the host aircraft. For example, explosive or rapid aircraft decompression may lead to the role equipment exploding if there is no pressure relief for sealed components, while aircraft vibration may cause internal short-circuits that generate sparks or fumes. Consequently, the role equipment should be verified to withstand the environmental conditions defined in the host aircraft's certification basis without posing a hazard to the host aircraft. Where the host aircraft certification basis for environmental qualification is uncertain, the requirements in Section 2 Chapter 9, Equipment Environmental Qualification, provide an initial benchmark for role equipment evaluation.

6.16 **Design Requirement.** *Role equipment should satisfy the relevant airworthiness design requirements for electromagnetic compatibility as prescribed in the aircraft certification basis.*

6.17 Aircraft electrical and electronic systems are designed to satisfy the electromagnetic compatibility requirements prescribed in the aircraft's certification basis. However, role equipment may not be designed to standards that provide a similar level of electromagnetic compatibility with the sometimes sensitive equipment found on aircraft. Consequently, role equipment should be evaluated prior to approval for use, to determine whether the equipment generates conducted or radiated emissions that could result in interference with aircraft systems. Where the host aircraft certification basis for E3 is uncertain, the requirements in Section 2 Chapter 4 provide an initial benchmark for role equipment evaluation.

6.18 **Design Requirement.** *Role equipment should satisfy the relevant airworthiness design requirements for electrical systems as prescribed in the aircraft certification basis.*

6.19 Aircraft electrical and electronic systems are designed to satisfy the electrical system requirements prescribed in the aircraft's certification basis. To ensure role equipment does not pose a hazard to the host aircraft, it should meet similar electrical system design requirements. This includes circuit protection, wire insulation type, battery protection, electrical loading and so on. Where the host aircraft certification basis for electrical systems is uncertain, the requirements in Section 3 Chapter 8 provide an initial benchmark for role equipment evaluation.

6.20 **Design Requirement.** *Role equipment should satisfy the relevant Authority prescribed airworthiness design requirements for oxygen systems detailed in Section 3 Chapter 6 of the DASDRM.*

6.21 Inadequately designed oxygen systems in role equipment may present a fire hazard. Role equipment designs and support systems should be evaluated to confirm that common risk reduction measures, such as filters on oxygen replenishing valves, skilled oxygen system maintainers, periodic servicing and so on are incorporated into the design and associated maintenance practices. Designs compliant with contemporary standards may be more forgiving of shortfalls in these risk reduction measures, due to a 'systems' approach to design that includes fire-resistant materials, filters, pressure reduction and so on.

6.22 **Design Requirement.** *Role equipment should be mounted within the host aircraft so that it will be restrained and retain its physical integrity when subjected to the maximum forces prescribed in the aircraft certification basis for a crash or hard landing.*

6.23 Role equipment may compromise the crash protection features of the host aircraft where it is not designed to, or is not mounted using devices that can, withstand the forces experienced during a

Superseded

crash or hard landing. Consequently, proposed role equipment and installation techniques should be evaluated prior to approval for use, to ensure that the equipment design can be appropriately restrained and can withstand applicable crash or hard landing forces.

6.24 **Design Requirement.** *Role equipment should not pose a personnel hazard, either in flight or during emergency egress.*

6.25 Role equipment designs may introduce physical hazards to on-board personnel that are not present in the 'normal' operational environment of the equipment. For example sharp edges may result in injury when personnel are required to move around the equipment in the confined space of an aircraft cabin, or the equipment may become a snag hazard during aircraft evacuation. Consequently, role equipment should be evaluated prior to approval for use, to ensure that hazards are identified and risks appropriately treated.

6.26 **Continuing airworthiness requirement.** *Where relevant, the responsible CAMO should establish a system for monitoring and managing changes in role equipment configuration, to confirm they continue to be compatible with the host aircraft.*

6.27 **Continuing airworthiness requirement.** *Where degradation of the role equipment may pose a hazard to the host aircraft, CAMOs should establish a maintenance management program for the equipment.*

6.28 While safe operation of role equipment on Defence aircraft will initially be established through the technical evaluation in support of role equipment approval, inadequate maintenance practices or changes in equipment configuration may compromise the level of safety established during this initial evaluation.

PORTABLE ELECTRONIC EQUIPMENT

6.29 Portable Electronic Equipment (PEE) is ubiquitous in modern society and is increasingly being used to support operational capability in Defence. Unlike other types of role equipment, the nature of PEE is such that it (normally) has limited potential for impact on aviation safety. For many common types of PEE, a risk assessment may determine that operational controls are sufficient to minimise the risks associated with PEE use without the need for a robust technical assessment. However, Defence may seek to use PEE that inherently poses unique hazards, such as intentional emitters, or in aircraft that have design features that pose unique hazards for PEE use, such as exposed sensitive equipment and wiring. Under these circumstances, additional technical evaluation of the PEE is warranted, to identify potential hazards and minimise associated risks. This section presents guidance to engineers on the PEE considerations that should be taken into account when providing technical advice to support PEE approvals.

6.30 All PEE approvals should be supported by a technical assessment. The level and scope of assessment required is relative to the impact of the PEE on safe flight and occupant safety, ie the potential hazards that PEE use introduces. Thus, the identification and characterisation of hazards to inform risk management decisions including the implementation of operational controls, is the focus of the technical assessment. To assist engineers to define the scope and level of assessment required, the following potential impacts on safe flight and occupant safety should be considered:

(a) **Safe flight:** Potential EMI/EMC associated with broadband unintentional emissions, or with intentional emissions where the PEE is required to be used as a functional transmitter during flight. Frequency and power of the emissions and the potential for the PEE to be used in close proximity to sensitive electrical/electronic safety of flight systems should be considered. The

Superseded

technical assessment should also consider the effect of limiting use to 'flight mode' or establishing 'safe zones' within the aircraft for transmitting PEE on the hazard.

(b) **Occupant safety:** Possible battery overheat/fire issues (for Li-ion batteries). Electrical overheat or battery fires may generate smoke and fumes and/or lead to cabin fires. Additional hazards associated with the presence of flammable materials (or materials that do not meet common practice aviation flammability requirements) may be present in military aircraft. The impact of such materials on occupant safety, eg the presence of additional/hazardous smoke/fumes, should be evaluated. Some PEE, for example laptop computers, may require suitable restraint during take-off and landing to avoid the PEE compromising occupant safety during a crash or hard landing.

6.31 Some PEE may have previously been subject to evaluation by operators of civil and military aircraft and approved for use under the applicable operational regulations. For this PEE, such prior approvals may be used to support similar approvals on Defence aircraft, and can limit the technical assessment required, provided that the Defence aircraft CRE is substantially similar to that of the aircraft on which the PEE was previously approved. The following paragraphs present additional guidance material to assist engineers in developing advice to operational commanders to support PEE approvals.

PEE Evaluation

6.32 Major civil NAAs (EASA, FAA and CASA) have issued guidance to civil operators on the approval of PEE for use on aircraft. The following FAA, CASA and EASA documents provide detailed guidance for evaluating PEE for use on aircraft (including intentional emitter PEE) and provide a suitable benchmark for undertaking similar assessments for Defence aircraft:

(a) FAA AC 91.21-1D Use of Portable Electronic Devices Aboard Aircraft, or

(b) CASA Airworthiness Bulletin 23-003 Issue 2 Aid to Operators for the Expanded Use of Passenger PEDs, or

(c) EASA Part-CAT AMC/GM – to CAT.GEN.MPA.140 Portable Electronic Devices.

6.33 PEE 'safe zones'. In addition to the preceding generic PEE evaluation considerations, PEE may incorporate intentional emitters whose emissions may exceed the certified thresholds for aircraft systems interference. However, this PEE may still be operable in Defence aircraft provided that it is located in a region where the emissions do not interfere with safety of flight systems. These regions are known as PEE safe zones. For military aircraft, sensitive system components and wiring may be more accessible to occupants and, therefore, the potential for intentional emitters to adversely affect these systems may be greater than in similar civil aircraft. To permit the operation of this PEE, where relevant, establishing a PEE safe zone may be useful in controlling this potential hazard.

6.34 The establishment of a PEE safe zone permits operation of PEE, with only a limited evaluation to confirm that the emissions of the equipment do not exceed the maximum levels associated with the zone. Establishing this zone could reduce the effort required to approve individual PEE for use. Additional guidance on the methodology for establishing PEE safe zones is presented in Annex B.

CAPABILITY DESIGN REQUIREMENTS

6.35 Role equipment and PEE used on Defence aircraft may perform an important capability function. Therefore, the ability of the role equipment or PEE to adequately perform its function while in an aircraft environment should be established before the equipment is approved for use. Role equipment and PEE may also adversely impact mission systems and equipment on the aircraft,

Superseded

causing loss or degradation of capability. Consequently, the Authority has identified capability design requirements to support the identification of capability impacts on the role equipment/PEE and the aircraft.

Impact on role equipment/PEE capability

6.36 Issues associated with electromagnetic compatibility, electrical compatibility, environmental qualification, physical compatibility and useability may all impact the effectiveness of role equipment/PEE when used in a Defence aircraft. The following capability design requirements are not prescribed by the Authority, but should be considered when establishing the suitability of role equipment/PEE for use on Defence aircraft.

6.37 **Capability design requirement.** *Where failure of role equipment or PEE, due to exposure to aircraft environmental conditions, will affect Defence capability, the equipment should be evaluated against the environmental design requirements applicable to the host aircraft.*

6.38 **Capability design requirement**. *Where failure of role equipment or PEE, due to exposure to the aircraft's electromagnetic environment, will affect Defence capability, the equipment should be evaluated against the electromagnetic susceptibility requirements applicable to the host aircraft.*

6.39 Role equipment and PEE may not be designed to withstand the often hostile environmental conditions experienced in the host aircraft. Given that some role equipment/PEE is essential to achieve required capability outcomes (eg aeromedical evacuation equipment, which performs a critical role in patient treatment and survival in an aircraft), ensuring that the equipment can continue to function correctly in an aircraft environment is necessary. Consequently, role equipment/PEE design and proposed installation should be evaluated to ensure that equipment functions will not be adversely affected when subjected to the physical (vibration, temperature, dust/moisture laden environments, noise and so on) and electromagnetic environmental conditions experienced by the host aircraft.

6.40 **Capability design requirement.** *Where role equipment or PEE are to be connected to the aircraft's electrical system, the electrical interface should be evaluated to confirm compatibility with the role equipment or PEE.*

6.41 Physical and functional compatibility with the aircraft's electrical power system should be verified for role equipment and PEE that will require aircraft power to operate correctly. This may require modification of the equipment if aircraft power characteristics (eg voltage and frequency stability, filtering and so on) are inadequate.

6.42 **Capability design requirement.** *For first of type role equipment or PEE, the operator interface should be verified as compatible with the airborne environment.*

6.43 The airborne environment presents challenges for the role equipment operator that are not present in a ground environment. Issues such as aircraft movement during turbulence, inadequate lighting, cramped conditions, aircrew gloves and so on, may induce operator error unless human factors considerations are incorporated into the design process.

6.44 **Capability design requirement.** *Role equipment and PEE should be located and fitted to support operation in the host aircraft.*

6.45 Role equipment operators should be consulted to verify that the proposed location and fitment of the equipment in the host aircraft does not unacceptably degrade the operator's ability to use the equipment.

Superseded

Impact on host aircraft capability

6.46 **Capability design requirement.** *Role equipment should be evaluated to confirm that it does not adversely impact the operation of aircraft mission systems and equipment.*

6.47 Role equipment should be verified to not adversely impact the operation of mission systems and equipment, predominantly through EMI/EMC. Depending on the proposed location of the role equipment or PEE, and whether it is intended to be non-transmitting or transmitting during use, EMI/EMC impacts on sensitive mission systems may occur. The technical evaluation should confirm whether the role equipment/PEE has the potential to degrade mission system functions and provide advice on potential limitations on use that could eliminate or minimise the associated capability impact.

ROLE EQUIPMENT AND PEE DESIGN REQUIREMENTS GUIDANCE

6.48 Further guidance on implementing design requirements for role equipment and PEE can be provided by the chapter sponsor.

ROLE EQUIPMENT AND PEE DESIGN REQUIREMENTS GUIDANCE

GUIDANCE FOR ROLE EQUIPMENT DESIGN REQUIREMENTS

INTRODUCTION

(a) DASDRM Section 5 Chapter 6 presents the Authority prescribed design requirements for role equipment and Portable Electronic Equipment (PEE). This Annex provides guidance on design considerations for technical assessment of role equipment to support operational approvals.

ROLE EQUIPMENT DESIGN REQUIREMENTS - GUIDANCE

Role equipment System Safety Analyses

(b) Role equipment may present unique hazards when operated on aircraft that are not likely to have been considered by the original designer of the equipment, and the equipment is unlikely to have been previously evaluated to confirm that it is physically compatible with the host aircraft. For example, the equipment may contain chemicals or other substances that could become hazardous to personnel or the aircraft structure if exposed (such as corrosive substances). Aircraft can also present a harsh environment for role equipment, and inadequately designed equipment may present a hazard to the host aircraft. Further, domestic appliances such as heaters or cooking equipment could pose a fire safety or leakage hazard. While these hazards may be acceptable in a non-aircraft environment (since the operator is likely to be able to evacuate the area) a similar approach to treating the hazard would not be suitable for aircraft operations. The following paragraphs provide specific guidance for identification of potential hazards associated with environmental conditions present in Defence aircraft, the general approach that should be adopted for conducting role equipment SSAs, and evaluating the safety of domestic appliances.

(c) Conducting role equipment SSAs. For aircraft systems, hazards are normally identified by implementing a robust system safety program supported by, inter alia, SSAs. Robust system safety programs are unlikely to have been followed during design development of role equipment and, where a system safety approach was taken, the role equipment is unlikely to have been designed with comprehensive hazard identification and treatment in mind, particularly for the aviation environment. However, the system safety approach to role equipment should be applied in a pragmatic manner. It would be easy for aviation engineers to apply an excessive level of rigour, and expend associated resources, to role equipment and implement a comprehensive systems safety approach when this is not warranted. Consequently, the following suite of requirements, based on MIL-STD-882 'tasks', provide a suggested basis for conducting system safety assessments for role equipment:

1. Task 106 – Hazard Tracking System. The hazards identified during the role equipment SSA should be incorporated into the host aircraft's hazard tacking system (usually via the Hazard log).

2. Task 205 – System Hazard Analysis. Conduct a SHA to the extent necessary to identify hazards relevant to role equipment use in the airborne environment and evaluate whether the hazards have been (or can be) effectively treated.

Superseded

3. Task 206 – Operating and Support Hazard Analysis. Evaluate proposed role equipment operations while on-board the host aircraft to identify whether operations introduce additional hazards and propose suitable risk treatment. Evaluate the support arrangements for the role equipment to identify if configuration changes to the equipment that may introduce hazards are adequately controlled.

4. Task 207 – Health Hazard Analysis. Evaluate role equipment to identify any potential health impacts on aircraft occupants associated with role equipment materials.

5. Task 303 – Test and Evaluation Participation. Where required, establish the parameters to be tested/verified during operational test and evaluation to support engineering assessment of the proposed role equipment.

6. Task 401 – Safety Verification. Identify any additional testing required to verify the safe operation of role equipment when on-board the host aircraft (eg additional environmental qualification or E3 testing).

Environmental qualification

(d) Role equipment is often designed for an application other than aircraft use and is adapted to suit a Defence capability requirement. Consequently, the equipment is unlikely to have been previously evaluated to confirm that it can safely operate when subjected to the (sometimes) extreme environmental conditions experienced by the host aircraft. For example, the equipment may contain components that are hermetically sealed and may be prone to explosive rupture if subjected to an explosive or rapid decompression. Long-term exposure to vibration environments often present in the host aircraft may lead to internal failure of components that provide specific hazard treatment, such as bonding and circuit protection, and result in electrical fires or smoke and fumes. The worst-case environmental conditions that the role equipment may be subjected to in the host aircraft should be established and the equipment evaluated against these conditions to determine if it can be safely installed and operated, prior to approval for use.

Electromagnetic compatibility

(e) Defence aircraft electrical and electronic systems are designed to satisfy the electromagnetic compatibility requirements prescribed in the aircraft's certification basis. However, role equipment may not be designed to standards that provide a similar level of electromagnetic compatibility with the sometimes sensitive equipment found on aircraft. Consequently, the equipment is unlikely to have been certified as compliant with the E3 design requirements prescribed for the host aircraft systems and equipment. Therefore, an evaluation of the role equipment should be undertaken to verify that there will be no impact on safe aircraft operations as a result of electromagnetic interference. This evaluation may require analysis of extant EMI/EMC certification of the role equipment or additional testing if required, and the establishment of any additional limitations on role equipment operation (eg phases of flight that the equipment can be safely operated or location of the equipment during operation).

(f) The requirements detailed in DASDRM Section 2 Chapter 4, Electromagnetic Environmental Effects can be used as a template for determining those elements of electromagnetic compatibility that require evaluation. Where the host aircraft certification basis for electromagnetic environmental effects is uncertain, the requirements in Section 2 Chapter 4 provide an initial benchmark for role equipment evaluation. Further information on electromagnetic compatibility issues is provided within the PEE guidance section of this Annex.

Electrical system design

Superseded

(g) Role equipment is unlikely to have been certified as compliant with the electrical systems design requirements prescribed for Defence aircraft. Many items of role equipment are designed to commercial specifications and standards, which provide significant latitude for designers when establishing whether the system is safe. For example, the wiring used in role equipment often is insulated using the cheapest and most reliable materials for the commercial application (eg PVC insulation). Such insulation may not be suitable for aircraft use. Therefore, any non-compliance with Defence aircraft electrical system requirements should be identified and the impact on safe aircraft operations, if any, established together with any associated limitations on role equipment operation (eg additional circuit protection, limitations on connection to aircraft power supplies or permitted battery types).

(h) The requirements detailed in DASDRM Section 3 Chapter 8, Electrical Systems can be used as a template for determining those elements of electrical systems compatibility that require evaluation. The following paragraphs detail specific guidance for role equipment electrical systems compatibility issues.

(i) **Electrical Wiring.** Several types of electrical wiring, for example those with Polyvinyl Chloride (PVC) or Polyimide (Kapton) insulation, exhibit undesirable properties and are therefore either prohibited or restricted for use in Defence aircraft. A similar approach should be adopted for role equipment wiring. DASDRM Section 3 Chapter 8 Electrical Systems, details the Authority prescribed design requirements for aircraft wiring which should be applied to role equipment where reasonable and pragmatic. Wiring that connects role equipment to aircraft power outlets should be routed so that it does not interfere with normal aircraft operations or impede access to, or use of, the role equipment.

(j) **Bonding.** Where practicable, all metallic components of role equipment should be electrically bonded to each other and to the airframe to protect the equipment and the aircraft against the effects of static electricity and lightning.

(k) **Battery Powered Equipment.** Role equipment with installed batteries should be subjected to regular inspections to ensure the battery is physically sound and no leakage of electrolyte has occurred. If these inspections are not included in the equipment servicing schedules, a pre-flight inspection of batteries should be included in an aircraft special (S) servicing for fitment of the role equipment. Batteries should be assessed to confirm that they are compatible with the worst-case environment likely to be experienced when the equipment is installed in the host aircraft.

(l) **Electrical Power Connections.** Where role equipment is to be connected to an aircraft power supply (either directly or through some form of power conversion equipment) military specification electrical connectors should be used wherever possible. Where this is not practicable, a safety assessment of the connectors should be conducted and any identified hazards appropriately treated.

(m) **Main Electrical Power Switch.** Each item of electrically powered role equipment that will utilise aircraft power should be fitted with a single ON/OFF power switch in the appropriate power line. The switch should be guarded and there should be an indication that the power supply is switched on. Circuit breakers should not be used to fulfil this requirement unless they have been specifically designed for this purpose.

(n) **Overcurrent Protective Devices.** Each item of electrically powered role equipment that will utilise aircraft power should be fitted with an overcurrent protective device. The protective device should be fitted as close as practicable to the entry point of power to the equipment.

Role equipment incorporating oxygen systems

Superseded

(o) Role equipment that incorporates an oxygen system is unlikely to be designed to Defence aircraft design standards and may therefore pose an increased fire hazard. In particular, items of role equipment used for medical purposes (Aeromedical Evacuation Equipment (AMEE)) are often commercially available equipment that is designed for hospital or general medical use using commercial specifications and standards, which provide significant latitude for designers when establishing whether the system is safe. For example, the oxygen piping used in role equipment is often PTFE tubing or similar, which is not usually suitable for aircraft systems and may pose an increased risk of leakage, or ignition and consequent fire hazard. Role equipment containing oxygen also presents particular hazards in an aircraft environment that may not be relevant in the equipment's 'normal' use (eg confined spaces and oxygen enriched atmospheres in the presence of oils/lubricants used on aircraft components). Further, compatibility with the host aircraft oxygen system must be established (eg aircraft oxygen systems provide dry breathing oxygen while most medical systems require oxygen with a defined moisture content) where the aircraft system will provide the oxygen supply. Connections between the host aircraft and role equipment systems must also be secure and prevent the escape of oxygen.

(p) While adoption of the host aircraft's oxygen system design requirements may appear reasonable, aircraft oxygen systems are designed within a system safety framework that provides a robust approach to identification and treatment of hazards. For oxygen systems, this approach results in a comprehensive risk treatment program that includes: filtration (for replenishment support equipment and at the aircraft system filler valve), pressure reduction, selection of fire resistant materials, prescribed maintenance practices and inspections, and so on. Role equipment oxygen systems, on the other hand, are unlikely to have been designed under the same rigorous approach to hazard identification and treatment. Consequently, oxygen systems in role equipment should be designed to comply with the requirements in DASDRM Section 3 Chapter 6, to ensure that a 'systems' approach to design is followed that includes fire-resistant materials, filters, pressure reduction and so on.

(q) Any non-compliance with Defence aircraft oxygen system requirements should be identified and the impact on safe aircraft operations should be evaluated before approval for use is granted. Further, any additional limitations or caveats on role equipment operation (eg additional testing required, limitations on connection to aircraft oxygen supplies or requirements for physical restraint of oxygen bottles) to ensure that the equipment can be safely installed and operated should be established and promulgated in associated role equipment and/or aircraft operating procedures.

Role equipment mounting and restraint

(r) Role equipment is unlikely to have been previously evaluated to confirm that it is physically capable of withstanding the significant forces involved in a crash or hard landing in an aircraft. The crash protection features of the host aircraft may be compromised by role equipment that is not designed to, or is not mounted using devices that can, withstand these forces. Consequently, role equipment must be capable of being restrained in such a manner that it does not become a projectile, or break apart, in a crash or hard landing.

(s) Role equipment should be evaluated prior to approval for use, to ensure that the equipment design can be appropriately restrained and can withstand crash or hard landing forces in the host aircraft. Any additional limitations on role equipment fitment or operation (eg location of the equipment during operation and/or physical restraint methods) to ensure that the equipment remains safe when installed in the aircraft should also be established and promulgated in relevant equipment and/or aircraft procedures. The following paragraphs provide specific guidance for role equipment mounting.

Superseded

(t) **Fastener Hardware.** Fasteners should be suitable for the intended application and retain items securely without loss of joint integrity or separation of fastener parts when the equipment is subjected to the maximum expected vibration or to the likely loads experienced during a hard or crash landing. Screwed fasteners should be either of the self-locking variety or should be lock-wired to ensure security during operation.

(u) **Mounting and Securing.** Suitable restraint devices should be provided which are capable of securing the role equipment against the maximum load forces expected (advice should be sought from Air Movements Training and Development Unit (AMTDU) where required). For non-standard and trial modifications where role equipment is permanently attached to the aircraft rather than restrained in a manner similar to cargo, the restraint of equipment should be designed in accordance with the Aircraft Structural Integrity Management Plan (ASIMP). Floor loading of the item should not exceed values for each aircraft type as detailed by AMTDU. Removable attachments, when not in use, should be securely stowed on the equipment.

Personnel hazards

(v) Role equipment designs may introduce physical hazards to personnel when installed in Defence aircraft that are not present in the 'normal' operational environment of the equipment. Further, the equipment is unlikely to have been previously evaluated to confirm that it does not pose a hazard to personnel during flight or emergency evacuation. Physical design issues such as sharp edges or protruding components of the role equipment may also result in hazards that are not considered important for the equipment's 'normal' use, but may be substantial hazards in an aircraft environment, resulting in injury or entanglement in turbulence or evacuations. Equipment should be mounted in the host aircraft in a location that will not impede normal and emergency ingress/egress. Additionally, the equipment should not impede access to aircraft emergency equipment and systems such as manual landing gear extension areas.

Continuing airworthiness

(w) While safe operation of role equipment on Defence aircraft will initially be established through the evaluation in support of approval to operate the role equipment, inadequate maintenance practices or changes in role equipment configuration may compromise the level of safety established during this initial evaluation. Many items of role equipment are not aviation materiel and are therefore not managed by aircraft support agencies. In the past, role equipment issues as a result of failure to adopt appropriate maintenance practices or the incorporation of changes to the role equipment configuration (either approved by the managing CASG support organisation or under a 'field approval') have compromised role equipment safety. To avoid these issues, suitable maintenance programs and/or arrangements with the role equipment or PEE managing CASG support organisation should be established to ensure that any such changes are communicated and can be evaluated for impacts on the extant approval for use.

Superseded

ANNEXES

ANNEX A - GUIDANCE FOR ROLE EQUIPMENT DESIGN REQUIREMENTS

GUIDANCE FOR ROLE EQUIPMENT DESIGN REQUIREMENTS

INTRODUCTION

(a) DASDRM Section 5 Chapter 6 presents the Authority prescribed design requirements for role equipment and Portable Electronic Equipment (PEE). This Annex provides guidance on design considerations for technical assessment of role equipment to support operational approvals.

ROLE EQUIPMENT DESIGN REQUIREMENTS - GUIDANCE Role equipment System Safety Analyses

(b) Role equipment may present unique hazards when operated on aircraft that are not likely to have been considered by the original designer of the equipment, and the equipment is unlikely to have been previously evaluated to confirm that it is physically compatible with the host aircraft. For example, the equipment may contain chemicals or other substances that could become hazardous to personnel or the aircraft structure if exposed (such as corrosive substances). Aircraft can also present a harsh environment for role equipment, and inadequately designed equipment may present a hazard to the host aircraft. Further, domestic appliances such as heaters or cooking equipment could pose a fire safety or leakage hazard. While these hazards may be acceptable in a non-aircraft environment (since the operator is likely to be able to evacuate the area) a similar approach to treating the hazard would not be suitable for aircraft operations. The following paragraphs provide specific guidance for identification of potential hazards associated with environmental conditions present in Defence aircraft, the general approach that should be adopted for conducting role equipment SSAs, and evaluating the safety of domestic appliances.

(c) Conducting role equipment SSAs. For aircraft systems, hazards are normally identified by implementing a robust system safety program supported by, inter alia, SSAs. Robust system safety programs are unlikely to have been followed during design development of role equipment and, where a system safety approach was taken, the role equipment is unlikely to have been designed with comprehensive hazard identification and treatment in mind, particularly for the aviation environment. However, the system safety approach to role equipment should be applied in a pragmatic manner. It would be easy for aviation engineers to apply an excessive level of rigour, and expend associated resources, to role equipment and implement a comprehensive systems safety approach when this is not warranted. Consequently, the following suite of requirements, based on MIL-STD-882 ‘tasks’, provide a suggested basis for conducting system safety assessments for role equipment:

1. Task 106 – Hazard Tracking System. The hazards identified during the role equipment SSA should be incorporated into the host aircraft’s hazard tacking system (usually via the Hazard log).

2. Task 205 – System Hazard Analysis. Conduct a SHA to the extent necessary to identify hazards relevant to role equipment use in the airborne environment and evaluate whether the hazards have been (or can be) effectively treated.

3. Task 206 – Operating and Support Hazard Analysis. Evaluate proposed role equipment operations while on-board the host aircraft to identify whether operations introduce additional hazards and propose suitable risk treatment. Evaluate the support

Superseded

arrangements for the role equipment to identify if configuration changes to the equipment that may introduce hazards are adequately controlled.

4. Task 207 – Health Hazard Analysis. Evaluate role equipment to identify any potential health impacts on aircraft occupants associated with role equipment materials.

5. Task 303 – Test and Evaluation Participation. Where required, establish the parameters to be tested/verified during operational test and evaluation to support engineering assessment of the proposed role equipment.

6. Task 401 – Safety Verification. Identify any additional testing required to verify the safe operation of role equipment when on-board the host aircraft (eg additional environmental qualification or E3 testing).

Environmental qualification

(d) Role equipment is often designed for an application other than aircraft use and is adapted to suit a Defence capability requirement. Consequently, the equipment is unlikely to have been previously evaluated to confirm that it can safely operate when subjected to the (sometimes) extreme environmental conditions experienced by the host aircraft. For example, the equipment may contain components that are hermetically sealed and may be prone to explosive rupture if subjected to an explosive or rapid decompression. Long-term exposure to vibration environments often present in the host aircraft may lead to internal failure of components that provide specific hazard treatment, such as bonding and circuit protection, and result in electrical fires or smoke and fumes. The worst-case environmental conditions that the role equipment may be subjected to in the host aircraft should be established and the equipment evaluated against these conditions to determine if it can be safely installed and operated, prior to approval for use.

Electromagnetic compatibility

(e) Defence aircraft electrical and electronic systems are designed to satisfy the electromagnetic compatibility requirements prescribed in the aircraft's certification basis. However, role equipment may not be designed to standards that provide a similar level of electromagnetic compatibility with the sometimes sensitive equipment found on aircraft. Consequently, the equipment is unlikely to have been certified as compliant with the E3 design requirements prescribed for the host aircraft systems and equipment. Therefore, an evaluation of the role equipment should be undertaken to verify that there will be no impact on safe aircraft operations as a result of electromagnetic interference. This evaluation may require analysis of extant EMI/EMC certification of the role equipment or additional testing if required, and the establishment of any additional limitations on role equipment operation (eg phases of flight that the equipment can be safely operated or location of the equipment during operation).

(f) The requirements detailed in DASDRM Section 2 Chapter 4, Electromagnetic Environmental Effects can be used as a template for determining those elements of electromagnetic compatibility that require evaluation. Where the host aircraft certification basis for electromagnetic environmental effects is uncertain, the requirements in Section 2 Chapter 4 provide an initial benchmark for role equipment evaluation. Further information on electromagnetic compatibility issues is provided within the PEE guidance section of this Annex.

Electrical system design

(g) Role equipment is unlikely to have been certified as compliant with the electrical systems design requirements prescribed for Defence aircraft. Many items of role equipment are designed to commercial specifications and standards, which provide significant latitude for

Superseded

designers when establishing whether the system is safe. For example, the wiring used in role equipment often is insulated using the cheapest and most reliable materials for the commercial application (eg PVC insulation). Such insulation may not be suitable for aircraft use. Therefore, any non-compliance with Defence aircraft electrical system requirements should be identified and the impact on safe aircraft operations, if any, established together with any associated limitations on role equipment operation (eg additional circuit protection, limitations on connection to aircraft power supplies or permitted battery types).

(h) The requirements detailed in DASDRM Section 3 Chapter 8, Electrical Systems can be used as a template for determining those elements of electrical systems compatibility that require evaluation. The following paragraphs detail specific guidance for role equipment electrical systems compatibility issues.

(i) **Electrical Wiring.** Several types of electrical wiring, for example those with Polyvinyl Chloride (PVC) or Polyimide (Kapton) insulation, exhibit undesirable properties and are therefore either prohibited or restricted for use in Defence aircraft. A similar approach should be adopted for role equipment wiring. DASDRM Section 3 Chapter 8 Electrical Systems, details the Authority prescribed design requirements for aircraft wiring which should be applied to role equipment where reasonable and pragmatic. Wiring that connects role equipment to aircraft power outlets should be routed so that it does not interfere with normal aircraft operations or impede access to, or use of, the role equipment.

(j) **Bonding.** Where practicable, all metallic components of role equipment should be electrically bonded to each other and to the airframe to protect the equipment and the aircraft against the effects of static electricity and lightning.

(k) **Battery Powered Equipment.** Role equipment with installed batteries should be subjected to regular inspections to ensure the battery is physically sound and no leakage of electrolyte has occurred. If these inspections are not included in the equipment servicing schedules, a pre-flight inspection of batteries should be included in an aircraft special (S) servicing for fitment of the role equipment. Batteries should be assessed to confirm that they are compatible with the worst-case environment likely to be experienced when the equipment is installed in the host aircraft.

(l) **Electrical Power Connections.** Where role equipment is to be connected to an aircraft power supply (either directly or through some form of power conversion equipment) military specification electrical connectors should be used wherever possible. Where this is not practicable, a safety assessment of the connectors should be conducted and any identified hazards appropriately treated.

(m) **Main Electrical Power Switch.** Each item of electrically powered role equipment that will utilise aircraft power should be fitted with a single ON/OFF power switch in the appropriate power line. The switch should be guarded and there should be an indication that the power supply is switched on. Circuit breakers should not be used to fulfil this requirement unless they have been specifically designed for this purpose.

(n) **Overcurrent Protective Devices.** Each item of electrically powered role equipment that will utilise aircraft power should be fitted with an overcurrent protective device. The protective device should be fitted as close as practicable to the entry point of power to the equipment.

Role equipment incorporating oxygen systems

(o) Role equipment that incorporates an oxygen system is unlikely to be designed to Defence aircraft design standards and may therefore pose an increased fire hazard. In particular, items of role equipment used for medical purposes (Aeromedical Evacuation Equipment (AMEE))

Superseded

are often commercially available equipment that is designed for hospital or general medical use using commercial specifications and standards, which provide significant latitude for designers when establishing whether the system is safe. For example, the oxygen piping used in role equipment is often PTFE tubing or similar, which is not usually suitable for aircraft systems and may pose an increased risk of leakage, or ignition and consequent fire hazard. Role equipment containing oxygen also presents particular hazards in an aircraft environment that may not be relevant in the equipment's 'normal' use (eg confined spaces and oxygen enriched atmospheres in the presence of oils/lubricants used on aircraft components). Further, compatibility with the host aircraft oxygen system must be established (eg aircraft oxygen systems provide dry breathing oxygen while most medical systems require oxygen with a defined moisture content) where the aircraft system will provide the oxygen supply. Connections between the host aircraft and role equipment systems must also be secure and prevent the escape of oxygen.

(p) While adoption of the host aircraft's oxygen system design requirements may appear reasonable, aircraft oxygen systems are designed within a system safety framework that provides a robust approach to identification and treatment of hazards. For oxygen systems, this approach results in a comprehensive risk treatment program that includes: filtration (for replenishment support equipment and at the aircraft system filler valve), pressure reduction, selection of fire resistant materials, prescribed maintenance practices and inspections, and so on. Role equipment oxygen systems, on the other hand, are unlikely to have been designed under the same rigorous approach to hazard identification and treatment. Consequently, oxygen systems in role equipment should be designed to comply with the requirements in DASDRM Section 3 Chapter 6, to ensure that a 'systems' approach to design is followed that includes fire-resistant materials, filters, pressure reduction and so on.

(q) Any non-compliance with Defence aircraft oxygen system requirements should be identified and the impact on safe aircraft operations should be evaluated before approval for use is granted. Further, any additional limitations or caveats on role equipment operation (eg additional testing required, limitations on connection to aircraft oxygen supplies or requirements for physical restraint of oxygen bottles) to ensure that the equipment can be safely installed and operated should be established and promulgated in associated role equipment and/or aircraft operating procedures.

Role equipment mounting and restraint

(r) Role equipment is unlikely to have been previously evaluated to confirm that it is physically capable of withstanding the significant forces involved in a crash or hard landing in an aircraft. The crash protection features of the host aircraft may be compromised by role equipment that is not designed to, or is not mounted using devices that can, withstand these forces. Consequently, role equipment must be capable of being restrained in such a manner that it does not become a projectile, or break apart, in a crash or hard landing.

(s) Role equipment should be evaluated prior to approval for use, to ensure that the equipment design can be appropriately restrained and can withstand crash or hard landing forces in the host aircraft. Any additional limitations on role equipment fitment or operation (eg location of the equipment during operation and/or physical restraint methods) to ensure that the equipment remains safe when installed in the aircraft should also be established and promulgated in relevant equipment and/or aircraft procedures. The following paragraphs provide specific guidance for role equipment mounting.

(t) **Fastener Hardware.** Fasteners should be suitable for the intended application and retain items securely without loss of joint integrity or separation of fastener parts when the equipment is subjected to the maximum expected vibration or to the likely loads experienced

Superseded

during a hard or crash landing. Screwed fasteners should be either of the self-locking variety or should be lock-wired to ensure security during operation.

(u) **Mounting and Securing.** Suitable restraint devices should be provided which are capable of securing the role equipment against the maximum load forces expected (advice should be sought from Air Movements Training and Development Unit (AMTDU) where required). For non-standard and trial modifications where role equipment is permanently attached to the aircraft rather than restrained in a manner similar to cargo, the restraint of equipment should be designed in accordance with the Aircraft Structural Integrity Management Plan (ASIMP). Floor loading of the item should not exceed values for each aircraft type as detailed by AMTDU. Removable attachments, when not in use, should be securely stowed on the equipment.

Personnel hazards

(v) Role equipment designs may introduce physical hazards to personnel when installed in Defence aircraft that are not present in the 'normal' operational environment of the equipment. Further, the equipment is unlikely to have been previously evaluated to confirm that it does not pose a hazard to personnel during flight or emergency evacuation. Physical design issues such as sharp edges or protruding components of the role equipment may also result in hazards that are not considered important for the equipment's 'normal' use, but may be substantial hazards in an aircraft environment, resulting in injury or entanglement in turbulence or evacuations. Equipment should be mounted in the host aircraft in a location that will not impede normal and emergency ingress/egress. Additionally, the equipment should not impede access to aircraft emergency equipment and systems such as manual landing gear extension areas.

Continuing airworthiness

(w) While safe operation of role equipment on Defence aircraft will initially be established through the evaluation in support of approval to operate the role equipment, inadequate maintenance practices or changes in role equipment configuration may compromise the level of safety established during this initial evaluation. Many items of role equipment are not aviation materiel and are therefore not managed by aircraft support agencies. In the past, role equipment issues as a result of failure to adopt appropriate maintenance practices or the incorporation of changes to the role equipment configuration (either approved by the managing CASG support organisation or under a 'field approval') have compromised role equipment safety. To avoid these issues, suitable maintenance programs and/or arrangements with the role equipment or PEE managing CASG support organisation should be established to ensure that any such changes are communicated and can be evaluated for impacts on the extant approval for use.

ANNEX B - GUIDANCE ON ESTABLISHING PEE SAFE ZONES

GUIDANCE ON ESTABLISHING PEE SAFE ZONES

INTRODUCTION

(a) PEE may incorporate intentional emitters whose emissions may exceed the certified thresholds for aircraft systems interference. However, some larger Defence aircraft may support the establishment of a PEE safe zone that permits the operation of PEE, with only a limited evaluation to confirm that the emissions of the equipment do not exceed the maximum levels associated with the zone. Establishing this zone could reduce the effort required to approve PEE for use. To support the operation of PEE on Defence aircraft, where relevant, PEE safe zones can be established. This Annex provides guidance on design considerations for establishing PEE safe zones to support operational approvals.

PEE SAFE ZONES - GUIDANCE Impact of PEE on Aircraft systems

(b) Defence aircraft are normally designed to be more immune to electromagnetic radiation than civilian aircraft. Despite this, Defence aircraft may in fact be more susceptible to interference from PEE for the following reasons:

1. **Physical Separation.** Electromagnetic energy decreases rapidly with distance, and therefore physically separating PEE from aircraft equipment is an effective means of minimising interference. In civilian aircraft, PEE are almost always used in clearly defined areas (that is, while the passenger is seated), and therefore the physical separation between PEE and aircraft equipment/wiring can be incorporated into the aircraft design. Military aircraft, on the other hand, do not always have clearly defined seating positions, they often have equipment racks and looming within the passenger compartment, and they allow passengers to move freely throughout the entire passenger compartment.

2. **Differences in Role.** Unlike civilian aircraft, the mission effectiveness of Defence aircraft is dependent on a wide array of electromagnetically sensitive equipment, for example, electro-explosive devices (EEDs), a profusion of antennas, sensitive role equipment and so on. Interference from PEE can therefore be more than just a ‘nuisance’ factor, and its acceptability may depend on the configuration of the aircraft or even the particular mission phase.

3. **Modifications.** Military aircraft are likely to undergo many more modifications than civilian aircraft during their lifecycle. Each modification has the potential to reduce the overall electromagnetic ‘hardness’ of the aircraft. For example, the lack of space within military aircraft often leads to non-optimal equipment locations and routing of wires, new capabilities may incorporate additional antennas which increase the likelihood of interference, and any one poorly designed or incorporated modification can introduce vulnerabilities both in itself and also to other systems.

(c) Notwithstanding the above factors, larger Defence aircraft are likely to support the definition of PEE ‘safe zones’; that is, areas where the risk from PEE is equivalent to commercial aircraft, and therefore commercial airline precautions for PEE may provide a basis for confirming compatibility with the host aircraft (eg non-transmitting PEE may be used freely during all aircraft operational phases). The remaining areas of the passenger compartment may be considered PEE ‘danger zones’ and PEE should not be used unless specifically authorised.

Superseded

These PEE danger zones probably only account for a small portion of the available space in larger Defence aircraft.

(d) Once the PEE safe zone for an aircraft has been established, the operation of PEE during critical phases of flight (if an operational requirement) should be evaluated to confirm that such operation will not result in interference to aircraft systems.

Establishing PEE Safe Zones

(e) When assessing the interference potential between PEE and aircraft systems, three modes of coupling need to be considered, namely PEE-to-equipment, PEE-to-wiring and PEE-to-antennas. Once the safe distances for each of these modes have been established for a particular aircraft, a PEE safe zone can be defined.

(f) For illustration purposes, worst-case PEE emissions of 1 V/m (within a few centimetres of the PEE) will be assumed.[1]

(g) **PEE to Equipment Coupling.** In civil aircraft, the possibility of PEE coupling directly to critical aircraft equipment is discounted, probably because they cannot be collocated on civil aircraft. However, within military aircraft, electronic equipment is often located within, or immediately adjacent to, the passenger compartment. PEE-to-equipment coupling should therefore be considered.

(h) Safety-critical equipment on an aircraft will normally be rated to withstand between 100V/m and 200V/m. Even allowing for significant degradation of the equipment over its lifecycle, susceptibility to PEE emissions for this equipment is still exceedingly unlikely. However, some categories of non-critical aircraft equipment only require testing to 1V/m. In this case, even without allowing for some equipment degradation over the years, there is potential for PEE interference. Consequently, some separation between equipment and PEE would be prudent.

(i) To determine a 'PEE safe zone' from equipment, a survey of the equipment in the aircraft passenger compartment would be required, followed by an assessment of the electromagnetic immunity of each piece of equipment. Some testing of the shielding effectiveness of the equipment racks or bulkheads could also be incorporated into the assessment. Adequate safety margins would then be added, and the resulting safe zone defined. If deemed necessary, some limited testing might be conducted to confirm the analysis.

(j) **PEE-to-Wiring Coupling.** While civil research[2] has concluded that harmful interference from PEE is unlikely to couple onto cables, the methodology used to arrive at this conclusion was questionable, and may be a reflection of the limited scope of analysis undertaken in the study. For Defence aircraft, the conducted susceptibility rating of equipment, the shielding effectiveness of applicable wires and the worst-case PEE emissions should be used to derive an appropriate separation distance.

(k) **PEE-to-Antenna Coupling.** The extremely small signal levels used by aircraft antennas (including connectors and associated cabling) makes them a prime target for interference from PEE. While it would be possible (with substantial difficulty) to predict how PEE might couple to an aircraft's antenna systems, the results are unlikely to be particularly useful since they rely on a number of independent conditions that are difficult to establish. Realistically, the chance of a PEE insidiously affecting aircraft systems via antenna coupling is extremely low, since there would normally be some outward sign of interference (eg erratic pointer movement, 'buzzing' or 'hash' over communications and so on). Given that banning all PEE is not a realistic option, the original civil alternative was to ensure that PEE were used only

Superseded

during non-critical phases of flight. However, recent research conducted by the FAA and EASA has concluded that such restrictions are unnecessary, provided that the PEE can be operated in a non-transmitting mode. This may provide an abbreviated approach for assessing the suitability of PEE for use on civil-derivative aircraft.

Operation of Transmitting PEE

(l) If transmitting PEE is to be used in a host aircraft, the safe distances from safety-critical and mission-critical equipment and wiring (based on the immunity ratings of the equipment) can be calculated. In addition, a frequency band assessment may be conducted to determine likely interference with the aircraft's radios and navigation systems. A suitable safety margin should then be added to all analysis figures, and an appropriate area of the aircraft assigned for the transmitter. Source/victim testing should then be conducted, first on the ground and then airborne, to verify the validity of the analysis.

Operation of PEE Outside the Safe Zone

(m) The following provides guidance for assessing PEE for use in the PEE 'danger zone':

1. If the approximate emission levels of the PEE are known (eg it is a common brand name, and marked as tested to a recognised commercial E3 standard) and it will not be used in the vicinity of safety-critical equipment/wiring, little further analysis would probably be required. Source/victim testing might be used if there was thought to be potential for interference with mission-critical equipment or wiring.

2. If there is any uncertainty in the device's emission levels it may require testing to a known standard, either commercial or military.

3. If the device is to be used immediately adjacent to safety-critical equipment or wiring then it should be tested to a stringent level that is known not to interfere with any aircraft systems (eg MIL STD 461E). Similarly, if there is any uncertainty as to where in the aircraft the device might be used, such testing may also be required.

PEE supporting urgent/contingency capability

(n) Defence capability needs may require the operation of a PEE of unknown characteristics in a host aircraft. In these circumstances, there may be limited opportunity to conduct even a limited technical evaluation to determine whether the device can be safely operated on the host aircraft. Nevertheless, an operational assessment of the device (using an abridged source/victim test methodology for example) should be conducted to provide some measure of confidence that the device will not pose an unacceptable risk to safe flight.

Superseded

PETROLEUM, OILS, LUBRICANTS AND ALLIED PRODUCTS

7.1 Petroleum, Oils, Lubricants and Allied Products (POLAP) refers to the fuels, oils, hydraulic fluids, greases, corrosion inhibitors and coolants that are used within or applied to aircraft. POLAP requirements for Defence aircraft, and the approval of such products, are considered during the aircraft (and/or engine) type certification and are documented within the certified type design. Approved POLAP is detailed in either the Type Certificate Data Sheet (for aircraft and/or aircraft engines), or in associated aircraft and engine Instructions for Continued Airworthiness (ICA), including the aircraft flight manual.

7.2 Consequently, the Authority does not prescribe airworthiness design requirements for POLAP. Compliance with the requirements for establishing the approved suite of POLAP for an aircraft/engine per the recognised NAA/MAA Airworthiness Codes at Section 1 Chapter 2 is appropriate.

7.3 Importantly, access to approved POLAP to support operations may have significant impacts on capability and interoperability. When seeking to acquire a Defence aircraft or aircraft engine, the responsible project office should engage with the Fuel Services Branch (FSB) to ensure that approved POLAP will be available for all proposed operational scenarios.

7.4 In-service management requirements for POLAP are documented in DEF(AUST) 206 Petroleum, Oils and Lubricants Handbook and DEF(AUST) 5695 Petroleum, Oils and Lubricants Manual. Further advice associated with management of POLAP for Defence aviation use can be provided by the FSB - Product Stewardship.

AIR NAVIGATION SYSTEMS

INTRODUCTION

8.1 Air Navigation Systems comprise that equipment necessary to provide an Air Navigation Service (ANS). DASR defines ANS as those services provided to air traffic during all phases of operations (approach, aerodrome and en route). Under DASR, ANS only includes air traffic management (ATM), meteorological services for air navigation (MET) and aeronautical information services (AIS). ATM is a generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. Under DASR the two subsets of ATM are 'Air Traffic Control' and 'Communications, Navigation and Surveillance'.

8.2 This chapter focuses on ATM equipment and does not provide design requirements for equipment used in MET/AIS services. Neither does the chapter cover the design of MET/AIS products provided to aircraft operators and ATM service providers. Further, when an ANS system comprises both ground-based and aircraft-based equipment, design requirements for the latter are provided in the relevant chapters of Section 3.

Scope

8.3 This chapter presents the Authority-prescribed aviation safety design requirements for ATM equipment. The design requirements are primarily based on International Civil Aviation Organisation (ICAO) and European Organisation for the Safety of Air Navigation (Eurocontrol) standards, supplemented where necessary by military-specific requirements. The chapter also discusses software safety assurance as it relates to software used within ATM equipment.

AIR TRAFFIC MANAGEMENT EQUIPMENT DESIGN REQUIREMENTS

8.4 Based on the ICAO taxonomy, ATM equipment within the scope of this chapter comprises the equipment in Table 1.

System	Equipment
Surveillance	Primary Surveillance radars
	Secondary Surveillance radars
	ADS-B Ground Station
	Surveillance Display System
	Universal Access Transceiver (UAT)
Radio Navigation aids	Instrument Landing System (ILS)
	Precision approach radar
	VHF Omnidirectional Ranging (VOR)
	Non Directional Beacon (NDB)
	Distance Measuring Equipment (DME)

Superseded

	VHF marker beacons
	Global Navigation Satellite System (GNSS)
	Microwave Landing System (MLS)
	Tactical Air Navigation System (TACAN)
Digital Data Communications Systems	Aeronautical communications network equipment
	Aeronautical Mobile-Satellite (Route) Service equipment (AMS(R)S)
	SSR Mode S Air-Ground Data Link
	VHF Air-Ground Digital Link (VDL)
	Aeronautical Fixed Telecommunications Network
	Aircraft Addressing System
	Point-to-Multipoint Communications
Voice Communications Systems	Aeronautical Mobile Service equipment
	Selective Calling (SELCAL) System equipment
	Aeronautical Speech Circuits

Table 1: Air Navigation System Equipment

8.5 Guidance. For achieving safe design and function for Air Navigation Systems, many systems have design requirements prescribed by the International Civil Aviation Organization (ICAO). These design requirements define those attributes of ANS or CNS equipment performance that underpin safe operation. In order to demonstrate compliance with the ICAO requirements referenced in this chapter, it is expected that, for the technical solution proposed, evidence will be produced to satisfy the outcomes listed in the relevant ICAO "documents" (ie Standards, Handbooks, Technical Provisions and Circulars). DASA can provide the latest complete list of ICAO documents that apply to the technical solution selected.

RADAR

PRIMARY SURVEILLANCE RADARS

8.6 Primary (independent or non-cooperative) surveillance radars (PSR) determine the position of objects in range and azimuth by illuminating a large portion of space with an electromagnetic wave and receiving back the reflected waves from objects within that space.

8.7 Unlike for other ANS equipment, ICAO does not publish PSR design requirements within its series of Annex 10 Aeronautical Telecommunications publications. Instead, the most comprehensive source of design requirements is the Eurocontrol Specification for ATM Surveillance System Performance, Eurocontrol-Spec-147, Edition 1.1, 2 Jul 15. However, the requirements within this standard relate to European airspace which is considerably denser than that typically encountered in Australia. Consequently, many of its requirements are overly prescriptive and need to be tailored for the Australian Defence application, including the use of deployable Defence Air Traffic management systems, where physical constraints, such as antenna size, affect performance. The PSR design requirements detailed below reflect this tailoring.

8.8 **Design Requirement (Essential).** PSR must comply with the following requirements within its Defence-defined technical commissioning volume, noting that the lower edge of the coverage

Superseded

volume shall be defined by screening by terrain, vegetation and/or infrastructure surrounding the radar:

(a) **Probability of Detection.** Within the defined PSR coverage volume of the SSR, the Probability of Detection (Pd) defined as the ratio of the number of target reports with measured position to the number of total expected reports shall be:

1. for a $2m^2$ target within the PSR coverage volume. ≥ 80%

2. for a $0.5m^2$ target within the PSR coverage volume to range ≤ 30NM and altitude ≤ 10k ft. ≥ 90%

(b) **False Target Reports.** Average number of false target reports per antenna rotation. ≤ 20

(c) **Performance requirements.** To demonstrate that a PSR meets the update, accuracy and specific requirements for safe and effective radar control service, it is required in to show compliance with the requirements of EUROCAE ED-261-1 Safety and Performance Requirements Standard for a Generic Surveillance System GEN-SUR SPR Volume 1. Specifically the requirements for the defined coverage volume of the radar.

8.9 **Design Requirement (Essential).** PSR as part of a cooperative surveillance system must provide the following message-structured and digitised information:

(a) **Positional data:** horizontal (2D) position and time of applicability of horizontal position (for conformity assessment).

(b) Surveillance data status: cooperative/non-cooperative/combined and coasted/not coasted (position).

SECONDARY SURVEILLANCE RADARS

8.10 Secondary (cooperative) surveillance radars determine the position of aircraft in range and azimuth using ground-based transmitters/receivers (interrogators) and aircraft-based transponders.

8.11 **Design Requirement (Essential).** Secondary Surveillance Radars must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Volume IV Surveillance and Collision Avoidance Systems, Edition 4, Chapters 2 and 3, except for the following:

(a) **Paragraphs 2.1.2.1.1-3.** Defence engages with Airservices Australia to co-ordinate various SSR matters such as the assignment of pulse recurrence frequencies, interrogator identification codes and surveillance identifier codes. Airservices Australia publishes information in Airways Engineering Instructions.

(b) those sections which provide requirements for aircraft transponders including reply transmissions initiated by the transponder.

(c) section 3.1.2.8.4 which provides the air-to-air transaction protocol.

8.12 **Design Requirement (Essential).** Secondary Surveillance Radars operating in Mode S must comply with the requirements of Eurocontrol Specification for European Mode S Station, Edition 4.0, 17 Aug 21.

Superseded

ADS-B GROUND STATIONS

8.13 Automatic Dependent Surveillance–Broadcast (ADS–B) is a surveillance technology in which an aircraft determines its position via satellite navigation or other sensors and periodically broadcasts it, enabling it to be tracked. The information can be received by ADS-B ground stations without interrogation signals from the ground.

8.14 **Design Requirement (Essential).** ADS-B Ground Stations must:

(a) comply with the requirements of EUROCONTROL ED-129B Technical Specification for a 1090MHz Extended Squitter ADS-B Ground Station, March 2016, except for the following:

1. **Paragraph 3.2.1.** The requirement for simultaneous processing of messages from at least 250 ADS-B targets is based on European traffic densities and may be reduced after appropriate analysis.
2. Paragraph 3.10.4.32 which concerns surface targets.
3. **Paragraph 4.1.** The relevant Australian environmental conditions are detailed in DEF(AUST) 5168/09 The Climatic and Environmental Conditions Affecting the Design of Military Materiel, Issue 2, May 2009.
4. Chapter 5 which concerns test procedures.
5. Chapter 6 which specifies the conditions for site acceptance testing.
6. Section 2.6 on software system integrity.

(b) ensure the ADS-B Sensor processing delay, under full load conditions, from the moment a valid ADS-B Radio Frequency message is received to the moment when the corresponding report starts to be transmitted at the ADS-B Sensor Data Output Interface shall not exceed 0.5 seconds.

(c) ensure that airborne messages are processed in accordance with the requirements of ICAO document 9871 Technical Provisions for Mode S Services and Extended Squitter.

(d) receive and process messages as defined in DO-260C Minimum Operational Performance Standards for 1090 Mhz Extended Squitter Automatic Dependent Surveillance - Broadcast (ADSB) and Traffic Information Services – Broadcast (TIS-B), December 17, 2020, except for those requirements relevant to aircraft systems.

(e) detect targets by receiving ADS-B transmissions within the Defence-defined Cooperative Target Coverage Measurement Volume.

SURVEILLANCE DISPLAY SYSTEMS

8.15 Surveillance Display Systems comprise that equipment which fuses inputs from various sensors and displays information to system operators, with the content and in the format required, for them to discharge their ATM roles and responsibilities. No single international standard provides a single source of appropriate design requirements.

Superseded

8.16 **Design Requirement (Essential).** Surveillance Display Systems must comply with the requirements of UK CAP 670 Air Traffic Services Safety Requirements, third issue, 1 Aug 19, SUR 11: Display System Requirements for Surveillance Systems except for:

(a) Ignore all references in round brackets which cross-reference to ICAO annex provisions through a UK CAA internal database).

(b) For those requirements which require an assessment and/or justification to determine their suitability/appropriateness for the operational environment, that assessment must consider the applicable system safety context. Relevant requirements are SUR11.23/24/25/26/28/36/46 and 85.

(c) Those requirements couched as recommendations are not essential.

(d) **SUR11.4.** Ignore reference to ANO 2016 Article 205.

(e) **SUR11.34.** The system shall comply with any relevant Australian low-voltage legislation.

(f) SUR11.45/72/76/81/83/111/125 which are not design requirements.

(g) SUR11.71 Notes 1 and 2 which are not design requirements.

8.17 **Design Requirement (Essential).** ATM display systems must comply with the following requirements:

(a) The mandatory performance requirements for 5 NM and 3NM horizontal separation detailed in Eurocontrol-Spec-047 Volume 1, except for the following:

1. **Section 3.4.3. REQ 5N_C-R3.** Ratio of missed position updates involved in long gaps (larger than 3 maximum update periods + 10%). Gap ratio in both 2D and 3D position updates ≤ 0.1%.
2. **Section 3.4.3. REQ 5N_C-R12.** Delay of change in emergency indicator/SPI report ≤ 12s in 95% of cases.
3. **Section 3.4.3 REQ 5N_C-R13.** Delay of change in aircraft identity ≤ 24s in 95% of cases.
4. **Section 3.4.4 REQ 3N_C-R3.** Ratio of missed position updates involved in long gaps (larger than 3 maximum update periods + 10%). Gap ratio in both 2D and 3D position updates ≤ 0.1%.
5. **Section 3.4.4. REQ 3N_C-R12.** Delay of change in emergency indicator/SPI report ≤ 7.5s in 95% of cases.
6. **Section 3.4.4 REQ 3N_C-R13.** Delay of change in aircraft identity ≤ 15s in 95% of cases.

(b) There should be one spare ATC Radar Data Processing (RDP) display per system available for use in the event of a single RDP Display failure.

(c) Where it is possible to change the QNH (or QFE) remotely, the system shall require the change to be drawn to the controller's attention and confirmed on all other displays.

(d) The display system must be designed to support the range of in-service integrity monitoring detailed in ICAO Document 8071 Manual of Testing of Radio Navigation Aids Volume III Testing of Surveillance Radar Systems, 1st edition, Amendment 2.

Superseded

8.18 Radio navigation aids apply radio frequencies to help aircraft fly specified navigation routes and aid approach, landing and departure. Various aids can provide angular directions, distances and sometimes velocities.

INSTRUMENT LANDING SYSTEM (ILS)

8.19 **Description of ILS.** The ILS is designed to provide an approach path for exact alignment and descent of an aircraft on final approach to a runway. The system may be divided functionally into three parts:

(a) guidance information: localizer, glide slope.

(b) range information: marker beacon and DME.

(c) visual information: approach lights, touchdown and centerline lights, runway lights.

8.20 **Design Requirement (Essential).** ILS must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1, Radio Navigation Aids, Section 3.2 Specification for ILS, except for the following:

(a) Paragraph 3.1.3.3.3. Note 2 only applies to the design of aircraft equipment

(b) Paragraph 3.1.3.10 Siting does not contain equipment design requirements and is therefore not applicable.

PRECISION APPROACH RADAR (PAR)

8.21 **Description of Precision Approach Radar.** A PAR is a radar guidance system designed to allow air traffic controller to provide lateral and vertical guidance to an aircraft for landing, until the landing threshold is reached.

8.22 **Design Requirement (Essential).** Precision approach radar must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1, Radio Navigation Aids, Section 3.2 Specification for precision approach radar system, except for the following:

(a) Paragraph 3.2.3.2 Siting does not contain equipment design requirements and is therefore not applicable.

VHF OMNIDIRECTIONAL RANGE (VOR)

8.23 **Description of VOR.** VOR is a type of short-range, line-of-sight radio transmitter enabling aircraft with a receiving unit to determine a bearing from the VOR station to the aircraft.

8.24 **Design Requirement (Essential).** VOR must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1 Radio Navigation Aids, Section 3.3 Specification for VHF omnidirectional radio range (VOR).

NON DIRECTIONAL BEACON (NDB)

8.25 NDBs are low or medium frequency radio beacons transmitting nondirectional signals whereby the pilot of a properly equipped aircraft can determine bearings and 'home' on the

Superseded

station. NDBs normally operate between 190-535 kHz, transmitting a continuous carrier with either 400 or 1020 Hz modulation.

8.26 **Design Requirement (Essential).** NDB must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1 Radio Navigation Aids, Section 3.4 Specification for non-directional radio beacon (NDB), except for the following:

(a) **Paragraph 3.4.4.1.** NDB radio frequencies are allocated by the Defence Spectrum Office.

(b) Paragraph 3.4 Siting of Locators does not contain equipment design requirements and is therefore not applicable.

(c) Paragraph 3.4.8 Monitoring does not contain equipment design requirements and is therefore not applicable.

DISTANCE MEASURING EQUIPMENT (DME)

8.27 In the operation of DME, paired pulses at a specific spacing are sent out from the aircraft (the interrogation) and are received at the ground station. The ground station (transponder) then transmits paired pulses back to the aircraft at the same pulse spacing but on a different frequency. The time required for the round trip of this signal exchange is measured in the airborne DME unit and is translated into distance from the aircraft to the ground station.

8.28 **Design Requirement (Essential).** DME must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1 Radio Navigation Aids, Section 3.5 Specification for UHF distance measuring equipment (DME), except for the following:

(a) Paragraph 3.5.2.6.3.1 does not contain equipment design requirements and is therefore not applicable.

(b) Paragraph 3.5.3.3.3. DME operating channels are allocated by the Defence Spectrum Office.

(c) Paragraph 3.5.3.3.4 Area channel assignment. The number of specific DME operating channels shall be decided in coordination with Air Services Australia.

(d) Those sections of paragraphs 3.5.5.1 through 3.5.5.4 which only apply to aircraft interrogators.

(e) Paragraph 3.11.6 Airborne equipment characteristics which only applies to airborne equipment.

VHF MARKER BEACONS

8.29 **Description of VHF marker beacons.** A VHF marker beacon is a particular type of VHF radio transmitter which vertically radiates a distinctive pattern for providing position information to aircraft. VHF marker beacons are usually used in conjunction with an instrument landing system to give pilots a means to determine position along an established route to a destination runway.

8.30 **Design Requirement (Essential).** VHF marker beacons must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1 Radio Navigation Aids, Section 3.1.7 VHF Marker Beacons, except for the following:

(a) Paragraph 3.1.7.1.a. The Competent Authority is DASA.

(b) Paragraph 3.1.7.6 Siting does not contain equipment design requirements and is therefore not applicable.

Superseded

GLOBAL NAVIGATION SATELLITE SYSTEM

8.31 **Description of GNSS.** The GNSS is a space-based radio navigation system used to determine precise geo-spatial positioning anywhere in the world. The GNSS comprises a variety of satellite constellations (such as GPS, Galileo and GLONASS), aircraft receivers and ground based augmentation equipment.

8.32 **Design Requirement (Essential).** The ground-based GNSS elements must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1 Radio Navigation Aids, Section 3.7.3.5 Ground-based augmentation system (GBAS) and ground-based regional augmentation system (GRAS).

MICROWAVE LANDING SYSTEM (MLS)

8.33 **Description of MLS.** MLS is an all-weather, precision approach and landing guidance system to enable an approaching aircraft to determine when it is aligned with the destination runway and on the correct glidepath for a safe landing. The position information is provided in a wide coverage sector and is determined by an azimuth angle measurement, an elevation angle measurement and a range (distance) measurement.

8.34 **Design Requirement (Essential).** MLS must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume 1 Radio Navigation Aids, Section 3.11 Microwave Landing System (MLS) Characteristics, except for the following:

(a) Paragraph 3.11.5.2.6 Siting does not contain equipment design requirements and is therefore not applicable.

(b) Paragraph 3.11.5.3.6 Siting does not contain equipment design requirements and is therefore not applicable.

(c) Paragraph 3.11.6 Airborne equipment characteristics only applies to the design of aircraft equipment.

TACTICAL AIR NAVIGATION SYSTEM (TACAN)

8.35 **Description of TACAN.** TACAN is a fixed site or deployable, terrestrial, short-medium range, omnidirectional air navigation military capability that provides azimuth, range and identification information on a dedicated frequency (channel. This information can be received by aircraft suitably fitted with military TACAN equipment and interpreted by aircrew to conduct air navigation in Instrument Meteorological Conditions (IMC). The TACAN operates in the Ultra High Frequency (UHF) band and employs a combination of discrete and complementary channels for use in surface to air operations.

8.36 **Design Requirement (Essential).** TACAN must meet the requirements of:

(a) MIL-STD 291C for the receipt, processing and transmission of the Standard TACAN Signal by a ground station.

(b) the DME section of this chapter for the TACAN's DME functions and performance.

8.37 **Design Requirement (Essential).** TACAN must:

(a) be capable of providing:

Superseded

1. a distance reply signal with characteristics defined in MIL-STD-291C for up to and including 100 aircraft interrogations simultaneously.

2. a distance reply signal with tolerances defined in MIL-STD-291C for up to and including 100 aircraft interrogations simultaneously.

3. azimuth information and ground station identity information to an unlimited number of aircraft.

(b) provide azimuth, distance measurement and identification information to at least 100 aircraft simultaneously with 80% reply rate in X-mode and 75% reply rate in Y-mode to interrogating aircraft transponders.

(c) provide at all radials an acquisition range (distance and no bearing unlock) up to and including 35NM at 1,500ft relative to the siting position in clear line-of-sight. (Note 1An airborne receiver sensitivity of -89 dBW/m^2 is assumed. Note 2: Range performance requirements are based on ideal conditions (environmental/atmospheric, no line of sight obstructions etc.).

(d) provide at all radials an acquisition range (distance and no bearing unlock) up to and including 100NM at 10,000ft relative to the siting position in clear line-of-sight. Note 1: An airborne receiver sensitivity of -89 dBW/m^2 is assumed. (exception for Richmond). Note 2: Range performance requirements are based on ideal conditions (environmental/ atmospheric, no line of sight obstructions etc.).

(e) provide a system monitoring function that shall:

1. detect that the TACAN Mission System is providing a signal in space noncompliant with MIL-STD-291C signal in space requirements.

2. continuously verify all azimuth signal parameters, reply delay parameters and station identification signal timing parameters.

3. have a Continuous Built in Test (BIT) Function that shall detect.

4. 95% of TACAN Mission System faults.

5. TACAN faults to a single Line Replaceable Unit with a 98% level of confidence.

6. have a False Alarm Rate not exceeding one ‘no faults found’ per five continuous days of operation.

7. detect failure of the system monitoring function ability to monitor itself.

8. maintain a log of all monitored alarm information, all operator exercised functions and all operator configuration changes applied to the TACAN.

9. archive all logs produced for a period of no less than 30 days.

10. allow operators to retrieve archived information for performance analysis or investigation purposes.

11. raise an alarm when parameters no longer comply with MIL-STD-219C.

12. raise an alarm on detection of a system fault.

Superseded

13. provide both visual and audible alarms.

14. transmit system alarms to maintainers.

DIGITAL DATA COMMUNICATIONS SYSTEMS

8.38 **Description of Digital Data Communications Systems.** Digital data communication systems comprise those system using digital rather than analog technology.

AERONAUTICAL COMMUNICATIONS NETWORK EQUIPMENT

8.39 **Description of Aeronautical communications network equipment.** The aeronautical telecommunication network (ATN) comprises application entities and communication services which allow ground, air-to-ground and avionics data subnetworks to interoperate by adopting common interface services and protocols based on the International Organization for Standardization (ISO) open systems interconnection (OSI) reference model.

8.40 **Design Requirement (Essential).** Aeronautical communications network equipment must meet the requirements of ICAO Annex 10 Aeronautical Telecommunications Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 3 Aeronautical Telecommunication Network.

AERONAUTICAL MOBILE-SATELLITE (ROUTE) SERVICE EQUIPMENT (AMS(R)S)

8.41 **Description of AMS(R)S.** AMS(R) is a satellite-based communication service used for safety and regularity of flights.

8.42 **Design Requirement (Essential).** AMS(R)S must meet the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 4 Aeronautical Mobile-satellite (Route) Service (AMS(R)S), except for Section 4.5 on satellite design requirements.

SSR MODE S AIR-GROUND DATA LINK

8.43 Reserved.

8.44 Reserved.

VHF AIR-GROUND DIGITAL LINK (VDL)

8.45 **Description of VDL.** VDL is a datalink used to send information between aircraft and ground stations, and sometimes other aircraft.

8.46 **Design Requirement (Essential).** VDL must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 6 VHF Air-Ground Digital Link (VDL), except for the following:

(a) paragraph 6.1.2.1, Section 6.3 and 6.9.5.1.1.1 only apply to the design of aircraft equipment.

AERONAUTICAL FIXED TELECOMMUNICATIONS NETWORK (AFTN)

8.47 **Description of AFTN.** The AFTN is a worldwide system of aeronautical fixed circuits for the exchange of messages and/or digital data between aeronautical fixed stations having the same or compatible communications characteristics. The AFTN is used to exchange information relevant to

Superseded

aircraft operations such as distress messages, urgency messages, flight safety messages, meteorological messages, flight regularity messages and aeronautical administrative messages.

8.48 **Design Requirement (Essential).** AFTN Network equipment must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 8 AFTN Network.

AIRCRAFT ADDRESSING SYSTEM

8.49 **Description of Aircraft Addressing System equipment.** Aircraft addresses are twenty-four-bit identifiers, with blocks of identifiers allocated by ICAO to the State of Registry.

8.50 **Design Requirement (Essential).** Aircraft Addressing System equipment must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 9 Aircraft Addressing System, except for the following:

(a) paragraph 9.1 which applies to aircraft design.

POINT-TO-MULTIPOINT COMMUNICATIONS EQUIPMENT

8.51 **Description of Point-to-Multipoint Communications equipment.** Point-to-multipoint wireless communications relates to fixed wireless data communications, via radio or microwave frequencies, usually in the gigahertz range, that have a large number of nodes, end destinations or end users. It provides multiple paths from a single location to multiple locations.

8.52 **Design Requirement (Essential).** Point-to-Multipoint Communications equipment must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 10 Point-to-Multipoint Communications.

UNIVERSAL ACCESS TRANSCEIVER (UAT)

8.53 **Description of UAT.** A UAT is a data link specifically designed to support ADS-B, bit can also support flight information service broadcasts and traffic information service broadcasts from proximate traffic.

8.54 **Design Requirement (Essential).** UAT must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part 1 Digital Data Communication Systems, Chapter 12 Universal Access Transceiver (UAT), except for the following:

(a) Paragraph 12.1.3, Section 12.3, paragraphs 12.4.3.(a) and (c) only apply to aircraft equipment.

VOICE COMMUNICATIONS SYSTEMS

VHF AERONAUTICAL MOBILE SERVICE EQUIPMENT

8.55 **Description of VHF Aeronautical Mobile Service equipment.** The Aeronautical mobile service is a mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate; emergency position-indicating radiobeacon stations may also participate in this service on designated distress and emergency frequencies.

Superseded

8.56 **Design Requirement (Essential).** VHF Aeronautical Mobile Service equipment must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part II Voice Communication Systems, Chapter 2 Aeronautical Mobile Service, except for the following:

(a) Section 2.3 System Characteristics of the Airborne Installation only applies to aircraft equipment.

(b) Paragraph 2.4.1.8.2 only applies to aircraft equipment.

UHF AERONAUTICAL MOBILE SERVICE EQUIPMENT

8.57 **Description of UHF Aeronautical Mobile Service equipment.** The Aeronautical mobile service is a mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate; emergency position-indicating radio beacon stations may also participate in this service on designated distress and emergency frequencies.

8.58 **Design Requirement (Essential).** UHF Aeronautical Mobile Service equipment must comply with ETSI EN 302 617 Ground-based UHF radio transmitters, receivers and transceivers for the UHF aeronautical mobile service using amplitude modulation; Harmonised Standard for access to radio spectrum version V2.3.1 (2018-07). Use of another standard may be permissible after discussions with DoSA of Air Navigation Systems Providers.

SELECTIVE CALLING (SELCAL) SYSTEM EQUIPMENT

8.59 **Description of SELCAL system equipment.** SELCAL is a radio system used to alert an aircraft that a ground radio station wishes to communicate. A ground-based encoder and radio transmitter broadcasts an audio signal that is picked up by a decoder and radio receiver on the aircraft. The use of SELCAL allows an aircraft crew to be notified of incoming communications even when the aircraft's radio has been muted.

8.60 **Design Requirement (Essential).** SELCAL system equipment must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 2, Volume III Communication Systems, Part II Voice Communication Systems, Chapter 3 SELCAL System.

AERONAUTICAL SPEECH CIRCUITS

8.61 **Description of Aeronautical Speech Circuits.** Aeronautical Speech Circuits use analog means of transmitting voice through established circuits.

8.62 **Design Requirement (Essential).** Aeronautical Speech Circuits must comply with the requirements of ICAO Annex 10 Aeronautical Telecommunications, Edition 6, Volume III Communication Systems, Part II Voice Communication Systems, Chapter 4 Aeronautical Speech Circuits, except for the following:

(a) **Paragraphs 4.1.1/2.** The relevant ANSP shall decide the use and application of aeronautical speech circuit switching and signalling.

ATM SOFTWARE

8.63 Section 2 Chapter 3 describes the software safety assurance requirements for aviation software, namely software that is designed for installation within a part or appliance of an

Superseded

aeronautical product. Software is also used extensively in modern ATM systems to implement a range of functionality, some of which may be safety critical. Accordingly, as for aviation software, risks must be evaluated and treated during the development program through a robust software management system that incorporates the disciplines of software safety and software assurance.

8.64 This chapter defines the design requirements for robust applications of ATM software. It then identifies common approaches to the management of ATM software that meet the Authority's prescribed design requirements.

8.65 The design of ATM software that performs safety critical functions requires the application of two key software engineering principles that support the production of safe software:

(a) Software safety, which is integrated with system safety, where software hazards are identified, analysed and treated within the context of systems engineering principles.

(b) Software assurance, which defines the engineering rigour applied commensurate to the criticality of the functions performed by the Software.

SOFTWARE SAFETY – IDENTIFYING SOFTWARE-RELATED HAZARDS

8.66 A software specification error, design flaw, or the lack of initial safety requirements can contribute to or cause a system failure or erroneous operator behaviour. Software safety is used to address software's contribution to ATM hazards. It is an element of the ATM system safety and software development program and cannot be undertaken independently of the total effort.

8.67 **Design Requirement (Essential).** Software safety must be applied as part of the system safety program to identify any derived requirements and determine the worst credible failure condition for ATM software.

8.68 The Defence aviation approach to system safety and associated Authority prescribed requirements are detailed in Section 2, Chapter 2 and involves the identification of system level hazards. Software safety identifies the software contribution to those hazards, the development of derived requirements to mitigate the hazards and identifies the commensurate software assurance level to adequately mitigate the hazards. The following guidance is available to support the application of system safety to ATM systems:

(a) International good practice for system safety in the ATM context is published by EUROCONTROL Safety Assessment Methodology (SAM) – a framework of methods and techniques to develop safety assessment of changes to functional systems.

(b) System safety artefacts that support off-the-shelf systems must be considered for suitability in the Australian context.

8.69 Software safety brings together elements of traditional system safety approaches in conjunction with approaches used to address the unique properties of software. A major distinction of software safety assessments against the ATM level system safety aspects is the absence of likelihood (probabilities) for each consequence; i.e. while the consequences of software failures can be clearly identified, software risks cannot be characterised in terms of likelihood. Software failures will consistently occur given the same inputs or conditions. Instead, the worst credible failure conditions are assessed utilising methods such as Functional Hazard Assessment (FHA) and Hazard and Operability Study (HAZOP) to identify software related hazards, the consequences related to realisation of these hazards and potential mitigation actions. The worst credible failure condition of ATM software is dependent on how it influences functional hazards at the system level; i.e.

Superseded

software safety links the software architecture to hazards and their failure pathways through to the system level.

8.70 Software safety, when properly implemented, enables the proper identification and tracing of requirements, not only those applied from the system level, but also those requirements that are derived from design decisions. These derived requirements are used to incorporate design criteria and may be generic; e.g. performance and timing criteria or mandating the use of partitioning.

8.71 Since ATM software safety is a subset of ATM system safety, it must be an integral component of the formal system safety program discussed at Section 2, Chapter 2. The following documents present robust frameworks for identifying the relevant tasks, processes, activities, and guidance for inclusion in the ATM system safety program:

(a) IEEE-STD-1228-1994 Standard for Software Safety Plans.

(b) U.S. Department of Defence Joint Software Systems Safety Engineering Handbook, Version 1.0.

8.72 A software Assurance Level, commensurate with the worst credible failure condition identified, is utilised to establish the required software assurance safety objectives. Assurance Levels are obtained through proper application of the standards detailed in paragraph 16. The Authority is to be consulted on the use of other system or software safety standards as they may require tailoring to satisfy software safety objectives.

SOFTWARE ASSURANCE – MITIGATING SOFTWARE RELATED HAZARDS

8.73 Software assurance is closely coupled to software safety. As previously discussed, the Assurance Level for a given system is obtained through application of system safety and software safety. The assigned Assurance Level determines the processes applied to establish confidence that system development has sufficient rigour to limit the likelihood of development errors that could impact ATM safety.

8.74 **Design Requirement (Essential).** ATM software must satisfy the prescribed objectives required for the Software Assurance Level commensurate with its worst credible failure condition.

8.75 Software assurance is an activity that includes a range of certification objectives (or certification activities) to be satisfied in all phases of the development. The applicability of these certification objectives is dependent on the Assurance Level of the software, with higher Assurance Levels requiring an increased scope of certification objectives, thus providing a greater level of confidence in the software. The scope of certification objectives can cover the planning, requirements, development and verification phases of the program, as well as configuration management, quality assurance and certification liaison activities.

SOFTWARE LIFECYCLE – INTEGRATION OF THE SOFTWARE PRINCIPLES

8.76 ATM software has a life cycle that must be managed during development and in-service. Effective software life cycle management is an inherent part of the software safety and software assurance approaches. Software assurance objectives exist for assessment of the lifecycle processes and products, the rigour of which is based on the system Assurance Levels.

8.77 Effective management of the software life cycle ensures that compliance with the ATM software design requirements is considered at the planning stage, throughout development, and in-service operation. Software life cycle considerations can include supportability, documentation, tools, intellectual property, personnel expertise, interface control, problem reporting and tracking

Superseded

systems, language selection, and hardware requirements. In managing the ATM software life cycle, the Authority preferred approach is presented in ISO/IEC/IEEE 12207:2017(E) Systems and software engineering – Software life cycle processes.

AUTHORITY RECOGNISED APPROACHES TO ATM SOFTWARE

8.78 The Authority-recognised standard for ATM software assurance is EUROCAE ED109A/ RTCA DO278A Software Integrity Assurance Considerations for Communication, Navigation, Surveillance and Air Traffic Management (CNS/ATM) Systems of January 2012.

8.79 Two other internationally accepted ATM software assurance standards are:

(a) EUROCAE ED-153 Guidelines for ANS Software Safety Assurance of August 2009.

(b) IEC 61508 – Part 3 Functional safety of electrical/electronic/ programmable electronic safety-related systems – Part 3: Software requirements of April 2010.

8.80 Both these older standards may be appropriate for application to ATM software, but require greater care in their application to Defence ATM systems. Prior to adoption of these two standards, agreement on their application and any required tailoring should be sought from the Authority.

CNS / ATM CYBER SECURITY

8.81 Section 2 Chapter 12 describes the cyber security assurance requirements for protection of information systems against intentional unauthorised electronic interactions (IUEI). These cyber security threats are also applicable to modern CNS/ATM ground-to-ground or air-to-ground information systems, some of which may be safety critical. Accordingly, as for aviation systems, the implementation of a robust and effective cyber security approach to Defence CNS/ATM information systems design supports aviation safety. The objective of this approach is to take into account the interdependencies between aviation safety and security in order to mitigate the potential effects of cyber security threats on CNS/ATM airworthiness.

8.82 The desired cyber security outcomes for CNS/ATM systems are that:

(a) Information systems within Defence CNS/ATM systems are protected from IUEIs.

(b) Changes to the type design of in-service Defence CNS/ATM systems do not compromise protections from IUEIs.

(c) In-service management of Defence CNS/ATM systems contributes to protections from IUEIs through effective instructions for continuing airworthiness and an effective continued airworthiness management framework.

INITIAL CNS / ATM SYSTEM CERTIFICATION

8.83 **Cyber Security Requirement (Recommended).** CNS/ATM equipment, systems and networks, and their interconnections, should be protected from IUEIs that may result in adverse effects on the safety of the aircraft. CNS/ATM systems should ensure protection from IUEIs is considered during initial design. Protection should be ensured by demonstrating that the security risks have been identified, assessed and treated as necessary.

8.84 Compliance with this requirement can be demonstrated through adopting the cyber security processes defined in RTCA DO-393 Process Standard for Security Certification and Declaration of ATM ANS Ground Systems Specification dated 28 June 2022. This document guides organisations in

Superseded

the implementation of an information security framework that is consistent with aviation regulations through the following:

(a) Plan Certification/Declaration.

(b) Organization Level Information Security Objectives.

(c) Manage Risk.

(d) Information Security Incident Monitoring and Reporting.

(e) Set Claims and Collect Evidence.

(f) Verify Compliance.

8.85 Guidance material for conducting risk assessments can be found in RTCA DO-393 Process Standard for Security Certification and Declaration of ATM ANS Ground Systems Specification dated 28 June 2022. Designers should engage with the appropriate Defence cyber experts for assistance in determining the security environment, attack paths and associated level of threat.

8.86 **Cyber Security Requirement (Recommended).** Instructions for continuing airworthiness and a continued airworthiness management framework should be defined and promulgated to ensure that the security protections of the CNS/ATM equipment, systems and networks are maintained.

8.87 International good practice recognises that the management of cyber security risks extends into the operational life of CNS/ATM systems. Effective continued and continuing airworthiness programs need to be informed by the results of the security risk assessments created to support Information Security Certification / Declaration. Guidance on this requirement can be found in in RTCA DO-393 Process Standard for Security Certification and Declaration of ATM ANS Ground Systems Specification dated 28 June 2022.

CHANGES TO CNS / ATM SYSTEM DESIGN

8.88 **Cyber Security Requirement (Recommended).** Changes to the design of Defence CNS/ATM systems should ensure the ongoing protection from IUEIs, where known, that may result in adverse effects on the safety of the aircraft. Protection should be ensured by showing that the security risks have been identified, assessed and treated as necessary.

8.89 Changes to design may undermine the cyber security protections provided by the original certification, resulting in changes to cyber security hazards, their associated risks and overall cyber security posture. Accordingly, the process described in in RTCA DO-393 Process Standard for Security Certification and Declaration of ATM ANS Ground Systems Specification dated 28 June 2022 detailed in paragraph 3.2 should be followed. Designers should engage with the appropriate Defence cyber experts for assistance in determining the security environment, attack paths and associated level of threat.

8.90 **Cyber Security Requirement (Recommended).** Amendments to instructions for continuing airworthiness, and the continued airworthiness management framework should be promulgated as part of a change to type design, where necessary, to ensure that the security protections of the CNS/ATM equipment, systems and networks are maintained.

8.91 Changes to the CNS/ATM system design may require updates to the ongoing management of cyber security risks. Accordingly, the process described in in RTCA DO-393 Process Standard for Security Certification and Declaration of ATM ANS Ground Systems Specification dated 28 June 2022 detailed in paragraph 3.2.2 should be followed.

Superseded

8.92 Further guidance on implementing the ATM requirements prescribed in this chapter can be provided by the chapter sponsor.

Superseded

SECTION 6 - AERODROME DESIGN REQUIREMENTS

CHAPTER 1 - APPLICATION OF DESIGN REQUIREMENTS TO AERODROMES

APPLICATION OF DESIGN REQUIREMENTS TO AERODROMES

INTRODUCTION

1.1 Defence aerodromes are used for the arrival, departure and surface movement of both fixed wing and rotary wing aircraft. Whilst inadequate aerodrome design has no impact on aircraft airworthiness, it can have a direct and substantial impact on safe flight operations. Consequently, Defence aerodromes are an integral part of the Defence Aviation Safety Program (DASP) and are managed under the Defence Aviation Safety Regulations (DASR). Defence aims to ensure that the design of Defence aerodromes aligns with reputable standards, supplemented for the Defence context. This provides a robust basis for certification of Defence aerodromes and assists Defence in meeting WHS obligations relating to aviation safety.

STRUCTURE

1.2 This section is divided into the following chapters:

(a) Chapter 1. This chapter establishes the context to support the understanding of the aerodrome design requirements detailed in each of the remaining chapters of this section.

(b) Chapter 2. This chapter details the design requirements for land based aerodromes intended primarily for use by fixed wing aircraft.

(c) Chapter 3. This chapter details the design requirements for land based heliports.

(d) Chapter 4. This chapter details the design requirements for shipborne heliports.

BASELINE AERODROME DESIGN STANDARDS

1.3 As discussed in Section 1 Chapter 1, the Authority has recognised a suite of baseline design requirements for the safe design of Defence aircraft. The Authority follows a similar approach for Defence aerodromes, and recognises a suite of baseline aerodrome design standards that provide a sound foundation for safe flight operations of aircraft at Defence aerodromes. These baseline aerodrome design standards are prescribed by an appropriate authority that is determined to reflect international good practice, are integrated, are internally consistent and are kept up-to-date by the sponsoring authority. The baseline aerodrome design standards provide the starting point for sourcing specific aerodrome design requirements.

1.4 The baseline aerodrome design standard for land based aerodromes and land based heliports are:

(a) Land based aerodromes. The Civil Aviation Safety Authority (CASA) Part 139 (Aerodromes) Manual of Standards 2019 (MOS Part 139) (September 2019), including the MOS Part 139H -

Superseded

Standards Applicable to the Provision of Aerodrome Rescue and Fire Fighting Services (MOS Part 139H) (January 2005).

(b) Land based heliports. International Civil Aviation Organisation (ICAO) Annex 14 Aerodromes Volume 2 Heliports (July 2013, inclusive of amendments 6, 7 and 8 – Nov 2018).

1.5 Several different baseline aerodrome standards were used for shipborne heliports. These standards were selected and supplemented by the Authority, where needed, to develop the Australian Defence Force Maritime Materiel Requirements Set - DEF (AUST) 5000 - Volume 11 Ship Aviation Requirements (November 2017) for the Royal Australian Navy (RAN).

AERODROME DESIGN ELEMENTS

1.6 The baseline aerodrome standards adopted for Defence aerodrome certification comprise of a variety of design requirements and related matters, some of which are not within scope of this section. This section only provides aerodrome design requirements for physical design elements rather than design processes, maintenance requirements and operational requirements. Further, design elements are only included within this section where their design requirements form effective treatments to aerodrome-related aviation safety risks. The design elements used in this section, for both fixed wing and rotary wing operations, are listed in Annex A.

SUPPLEMENTATION OF BASELINE AERODROME DESIGN STANDARDS

1.7 Where required, the Authority varies or prescribes supplementation to the baseline design standards for specific aerodrome design elements. The variation or supplementation is made to specifically address situations where:

(a) the baseline standard is silent on specific design elements needed for Defence aerodromes, such as military-specific aerodrome design requirements.

(b) the baseline standard provides requirements for a specific aerodrome design element, but Defence experience has unequivocally demonstrated that these aerodrome design requirements need to be varied or supplemented when applied to Defence aerodromes.

(c) the baseline standard requirements need to be supplemented by mandatory Australian legislative design requirements, such as for electrical wiring.

1.8 Variation or supplementation is only made where there is no conflict with the baseline standard requirements for other design elements (given that the baseline standard comprises an integrated set of requirements).

ESSENTIAL VS RECOMMENDED DESIGN REQUIREMENTS

1.9 In the context of airworthiness design requirements, Section 1 Chapter 1 distinguishes between 'essential' and 'recommended' design requirements. While 'essential' design requirements are well defined in safety legislation and Defence policy and/or operational regulation requirements, 'recommend' design requirements represent 'good practice' that is not yet widely accepted/ implemented. In the aerodrome context, all design requirements prescribed in this section are considered to fall into the 'essential' category. Nevertheless, many of the requirements only apply in specific circumstances, so many aerodromes will never be required to contain all the design features described in the baseline aerodrome design standards. The set of applicable aerodrome design

Superseded

requirements for a given Defence aerodrome, must be agreed to by the Authority as part of an aerodrome certification program.

APPLICATION OF DESIGN REQUIREMENTS TO CERTIFIED AERODROMES

1.10 The aerodrome design requirements detailed in Chapters 2, 3 and 4 of this section apply to those Defence aerodromes which require Defence certification in accordance with DASR.139 - Aerodromes. The design requirements may be applied to other Defence aerodromes, as a treatment for those assessed risks that warrant more rigorous design requirements.

RELATIONSHIP TO OTHER SPONSORED DOCUMENTS

1.11 Whilst the following chapters in this section provide aviation safety-related aerodrome design requirements, they do not include non-aviation safety-related design requirements necessary for Defence capability, standardisation and interoperability with other defence forces.

1.12 For land based aerodromes and land based heliports, these requirements are detailed in various documents sponsored by the Directorate of Estate Engineering Policy (DEEP) within E&IG's Estate Engineering Governance and Integrity System (EEGIS). Collectively, the EEGIS documents are the repository for Defence's corporate solution to the design of land based aerodromes and land based heliports, documenting all the requirements necessary for Defence aerodromes to be operated safely and efficiently, and to allow effective force projection. For those design requirements relevant to aviation safety, the EEGIS documents refer to this section of the DASDRM.

1.13 For shipborne heliports, the non-aviation safety-related requirements are captured within the same document as the aviation safety-related aerodrome design requirements, that is, the DEF (AUST) 5000 - Volume 11 Ship Aviation Requirements (November 2017).

1.14 An aerodrome Certification Basis (CB) is required for each aerodrome requiring certification. While Defence's collective aerodrome design requirements comprise both those related to aviation safety (prescribed in this section) and those related to capability/interoperability (documented in the EEGIS), the aerodrome CB will only comprise of those design requirements necessary to demonstrate that the aerodrome can support safe flight operations; i.e. applicable requirements prescribed by the Authority in this section. Assessment of the design for the issue of an Aerodrome Certificate will only be performed against the requirements of the aerodrome CB.

ENGAGEMENT WITH DASA

1.15 The recognised baseline standards used in this section, occasionally identify a requirement to engage with designated authorities or other organisations. Where such a requirement is identified, except where expressly detailed in Chapter 2 and Chapter 3 of this section, readers are to engage with the DASA.

Annex:

A. Aerodrome Design Elements

Superseded

ANNEX A - AERODROME DESIGN ELEMENTS

AERODROME DESIGN ELEMENTS

(a) The following aerodrome design elements are used, where relevant, in Chapter 2, Chapter 3 and Chapter 4[1] of this section:

1. physical characteristics of movement facilities
2. aircraft arresting systems
3. obstacle restrictions and limitations
4. visual aids provided by aerodrome markings, markers, signals, wind direction indicators, and so on
5. visual aids provided by aerodrome lighting
6. Communication, Navigation, Surveillance (CNS) and Meteorological (MET) facilities
7. earthing points
8. light aircraft tie-down facilities
9. radio communication facilities
10. rescue fire fighting requirements.

(b) The following aerodromes design elements are outside the scope of Section 6:

1. facilities that may be on aerodromes associated with maintaining aircraft, such as hangars, corrosion control (including washes), spares storage, refuelling, ground power and de-icing
2. facilities that may be on aerodromes associated with aviation training and operations support
3. amenities on aerodromes such as accommodation and catering
4. aerodrome roads (apart from 'roadways' on aprons and emergency access roads) except to the extent that their lighting affects pilot vision.

Superseded

LAND-BASED AERODROMES

INTRODUCTION

2.1 This chapter details the design requirements for land based aerodromes primarily used by fixed wing aircraft. However, where applicable, it also contains design requirements for integrating rotary wing operations into these aerodromes.

2.2 Baseline design standards for land based aerodromes are contained in the CASA Part 139 (Aerodromes) Manual of Standards 2019 (MOS Part 139) (September 2019) and the MOS Part 139H - Standards Applicable to the Provision of Aerodrome Rescue and Fire Fighting Services (MOS Part 139H) (January 2005). Where required, the Authority varies or prescribes supplementation to the baseline design standards for specific aerodrome design elements.

2.3 Where reference is made to CASA, within both the MOS Part 139 and the MOS Part 139H, consultation should be undertaken with the DASA if there is any ambiguity, or further clarification required in implementing these requirements. No consultation or contact with CASA should occur.

2.4 Where the CASA term 'air transport operation' is used within both the MOS Part 139 and the MOS Part 139H, it is to be interpreted as follows:
Air transport operation means a passenger transport operation, a cargo transport operation or a medical transport operation.

AERODROME DESIGN REQUIREMENTS

2.5 The aerodrome design requirements and the associated variations and supplementations defined by the Authority for each of the identified design elements detailed in Chapter 1 Annex A of this section, are described below.

Design element: Physical characteristics of movement facilities

2.6 Design requirements. The design of the physical characteristics of movement facilities, such as runways, ground movement, parking and loading areas, must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 6, except for the following:

(a) *Paragraph 6.01 (6) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(b) ***Division 1 Runways – Application to emergency runways.*** *Where only one runway is available on an aerodrome used regularly by fighter jets, an emergency runway may be required. If required, this emergency runway, which must be located on a specified taxiway, must meet the following design criteria:*

1. ***Runway width.*** *The taxiway on which the emergency runway is situated, must meet at least the requirements of a code 2B runway with Outer Main Gear Wheel Span of 4.5m up to but not including 6m. That is, the minimum width must be 23m.*

Superseded

2. ***Strip width.*** *In accordance with an Aerodrome Reference Code (ARC) code number 2B non-instrument approach, the emergency runway strip must have a minimum width of 80m, centred on the taxiway.*

3. ***RESA.*** *A Runway End Safety Area (RESA) of 60m must be present at each end of the emergency runway.*

(c) ***Section 6.09 Runway surface.*** *The following variations to the MOS Part 139 (Aerodromes) requirements for runway surfaces apply:*

1. *Paragraphs 6.0.9 (2), (3) and (6) contain maintenance verification requirements rather than design requirements and are therefore not applicable to Defence aerodrome certification.*

2. *Paragraph 6.09 (5) applies to all Defence certified aerodromes.*

3. ***Surfaces near aircraft arresting systems.*** *The runway surface within 60m of an aircraft arresting system, on both the approach and departure sides, must satisfy the requirements of UFC 3-260-01 Airfield and Heliport Planning and Design, section 3-17.2.2, as they apply to USAF aerodromes.*

4. *Skid resistance for taxiways used as emergency runways must be considered during design and recorded at construction and after any major surface treatment.*

(d) *Paragraph 6.22 (2) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(e) *Paragraph 6.25 does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(f) *Paragraph 6.26 (3) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(g) ***Division 4 - Application to military aprons.*** *The MOS 139 requirements for aprons do not directly account for military special-purpose aprons, namely Operational Readiness Platforms (ORP), Explosive Ordnance Loading Aprons (EOLA) and Quick Reaction Alert Facilities (QRAF). In designing new military specific aprons or modifying existing aprons, the following Defence aerodrome requirements apply. Where the Authority prescribed requirements in this section conflict with the MOS 139 requirements, the requirements below take precedence.*

1. ***Design requirements - ORP.*** *ORPs must comply with the design requirements detailed in UFC 3-260-01, 6-8, Warm-Up Pad.*

2. ***Design requirements - EOLAs.*** *EOLAs must comply with the design requirements detailed in UFC 3-260-01, 6-10 Arm/Disarm Pads. The Director of Ordnance Safety (DOS) must be consulted on defining tailoring of these requirements for a specific aerodrome.*

3. ***Design requirements - QRAF.*** *QRAFs must comply with the design requirements detailed in UFC 3-260-01, 6-13 Alert Pad.*

Superseded

Design element: Aircraft arresting systems

2.7 Where an aerodrome, to be frequently used by high-speed jet aircraft, cannot be designed to include adequate Runway End Safety Areas (RESA), an Aircraft Arresting System (AAS) is required to recover (stop) an aircraft during an emergency landing or an aborted take-off. AAS types that may be used on Defence aerodromes are:

(a) aircraft arresting barriers, which engage and absorb the forward momentum of an aircraft by means of a net; and

(b) hookcable AAS, which engage hook-equipped aircraft and absorb forward momentum by means of a cable deployed across the runway.

*2.8 **Design requirement.** The AAS design must comply with the requirements of UFC 3-260-01 Airfield and Heliport Planning and Design, section 3-17, Aircraft Arresting Systems, except for the following:*

(a) ***Paragraph 3.17.1.** The requirements applicable to USN and Marine Corps AAS are not applicable.*

(b) *AAS must be designed and sited so that they do not compromise broader MOS 139 design requirements. To avoid AAS becoming obstacles to air navigation, AAS 'huts' must be located outside the graded portion of the runway strip.*

Design element: Obstacle restrictions and limitations

*2.9 **Design requirement.** The design of obstacle restrictions and limitations must comply with the requirements of MOS Part 139 (Aerodromes) Chapter 7, except for the following:*

(a) ***Paragraph 7.01(2).** Obstacle data requirements must be obtained from AIS-AF, as the relevant Air Navigation Service Provider (ANSP).*

(b) ***Paragraph 7.02(1).** Objects or structures, other than approved visual and navigational aids or Aircraft Arrestor Systems, must not be constructed or erected within the obstacle restriction area of an aerodrome without the written approval of the Authority. When making a determination on whether objects or structures should be considered an obstacle, the Authority will seek advice from E&IG Estate Planning – Land Planning.*

(c) ***Paragraph 7.03(4) Note.** E&IG Estate Planning – Land Planning will provide advice to the Authority on development requests for buildings and other infrastructure to be built in the obstacle limitation surface of Defence aerodromes, beyond the aerodrome boundary.*

(d) *Paragraphs 7.18-25 do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(e) ***Emergency runways.** Emergency runways must meet ARC code 2B non-instrument approach OLS requirements.*

Superseded

*2.10 **Design requirement.** The design of visual aids provided by aerodrome markings, markers, signals, signs, wind direction indicators and so on must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 8, except for the following:*

(a) ***Paragraph 8.27(3).** The provision of Runway Threshold Identification Lights is optional.*

(b) *Paragraph 8.29 (1)(b) and (3)(b) are not applicable to Defence aerodrome certification.*

(c) *Paragraph 8.30 (1)(a) is not applicable to Defence aerodrome certification.*

(d) ***Figure 8.31 (2)-2 through 5.** Requirements relevant to international air transport operations are not applicable to Defence aerodrome certification.*

(e) *Paragraph 8.38 Note is not applicable to Defence aerodrome certification.*

(f) *Paragraph 8.79 (4)(a) is not applicable to Defence aerodrome certification.*

(g) ***Paragraph 8.79 (7).** Consultation should occur with the relevant Military Air Operators. For a Defence Aerodrome where there is a Joint User Deed or a lease, there is also a requirement to consult with the joint user or leased operator.*

(h) *Paragraph 8.85 (1)(a) and (2)(a) are not applicable to Defence aerodrome certification.*

(i) ***Paragraph 8.93 MAGS with information.** An additional common military information sign is TACAN.*

(j) *Paragraph 8.109 (4) does not contain aerodrome design requirements and is therefore not applicable to Defence aerodrome certification.*

(k) ***Division 12 Helicopter areas on aerodromes**. The dimensions discussed in Division 12 are based on consideration of single-main-rotor helicopters. For helicopter areas designed to accommodate tandem-rotor helicopters, the design will be determined by analysis on a case-by-case basis for the specific model(s) of helicopter(s), incorporating clearances for safety, including the basic requirement for a safety area and specified protection areas. For the appropriate safety clearances for Chinook CH-47, the Type 1 parking requirements detailed in Figure 6.6 of UFC 3-260-01 (4 Feb 19) must be met.*

(l) ***Emergency runways.** An end bar and Permanent Survey Mark must be placed at each end of the emergency runway. The end bar is to be white and 0.45m thick. No other runway markings are required but additional markings may be applied if required by aerodrome stakeholders.*

(m) ***Distance to run markers.** With the exception of multi-lane runways, sealed runways are to be equipped with distance to run marker boards. As illustrated in Annex A, the markers must:*

1. *be sited on both sides of each sealed runway*
2. *indicate the runway distance remaining in thousands of feet (the last three digits being omitted)*
3. *be numbered from the upwind end of the runway, increasing towards the beginning of the runway, the figure `1' being 1 000 feet from the upwind end*
4. *be mounted vertically at right angles to the longitudinal axis of the runway and 18 m from the runway edge*

Superseded

5. *be displaced 100 feet from their true position if it coincides with a taxiway intersection (or may be omitted if the 100 feet displacement is insufficient)*

6. *be not less than 15 m from the edge of a taxiway*

7. *account for the length of the runway being other than a multiple of 1 000 feet. Half the odd length must be used at each end of the runway for computing the position of the markers. For example, runway length = 9800 feet, odd length = 800 feet, DTRM Board `1' = 1400 feet from each up wind end.*

(n) ***Distance to run marker board design.*** *Marker boards must be designed so that they:*

1. *measure 1.8 m in height and 1.2 m in width*

2. *display numbers 1.5 m in height, 0.9 m in breadth with a stroke of 13 cm*

3. *display white numbers on a black background*

4. *are of frangible construction to reduce aircraft damage should impact occur*

5. *are illuminated to ensure readability at night and in adverse weather conditions.*

(o) ***Hookcable markers.*** *On runways where hookcable AAS are installed, the position of the hookcable AAS is to be indicated by illuminated hookcable marker boards. As illustrated in Annex B, the markers must be:*

1. *placed on both sides of the runway in line with the hookcable pendant and equidistant from the runway centre line*

2. *positioned between 15 m and 23 m from the edge of the full strength pavement.*

(p) ***Hookcable marker board design.*** *The hookcable marker boards must be designed so that they:*

1. *comprise a yellow or orange disc one metre in diameter on a black background*

2. *are visible for both runway directions*

3. *are of frangible construction to reduce aircraft damage should impact occur*

4. *are illuminated to ensure readability at night and in adverse weather.*

(q) ***Hookcable runway markings.*** *On runways equipped with hookcable AAS, arresting system warning markings must be displayed on the runway at the point where the hookcable crosses the runway. The markings consist of a line of solid yellow circles 3 m in diameter located as shown at Annex C.*

(r) ***Navigation check point sign.*** *A Navigation check point sign must be installed on the approach taxiway leading onto the threshold of a runway at airfields where a navigation facility is installed. The sign is to identify itself as a 'TACAN CHECK' or 'POSITION CHECK' and provide information for the respective navigational aid. Further detail of pavement marking and sign detail is provided at Annex D.*

Superseded

2.11 ***Design requirement.*** *The design of aerodrome lighting must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 9, except for the following:*

(a) ***Paragraph 9.01 (3).*** *VASIS must be provided for all Defence certified aerodromes; however, T-VASIS and AT-VASIS are not acceptable design solutions. Double-sided PAPI should be installed, except where impractical to do so due to geometric constraints. In these situations a single-sided PAPI must be installed.*

(b) ***Paragraph 9.04 (4)(f).*** *Defence also considers taxiway routes, for operations in conditions less than 800 m, to be essential.*

(c) *Paragraph 9.06 does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(d) *Paragraph 9.07 (3)-(6) do not include design requirements and are therefore not applicable to Defence aerodrome certification.*

(e) ***Paragraph 9.10.*** *In addition to the MOS Part 139 (Aerodromes) defined requirements for visual aids provided by aerodrome lighting:*

1. *Where Defence aerodromes are required to provide lighting to support aircraft operating with Night Vision systems (known as Night Vision Imaging System (NVIS), Night Vision Device (NVD) or Night Vision Goggles (NVG)), the aerodrome lighting systems must satisfy compatibility requirements for the relevant Night Vision Imaging System (NVIS) Type and Class specified in use by all relevant aircraft. The aircraft systems NVIS Type and Class must align with those defined within DASDRM Section 3 Chapter 7.*

2. *The required capability for the Defence aerodrome must be defined and may be either 'Friendly' to NVIS operations or 'Covert'. Friendly is defined as 'NVD/NVG/NVIS Friendly - Lights that are specifically designed or adapted to be visible to both the unaided eye and to Night Vision Devices (NVDs), but which do not degrade, or minimally degrade, the performance of the NVDs in operational use.' Covert is defined as 'Covert - Lights that are designed to be invisible to the unaided eye but that are visible through NVDs.'*

3. *Lighting at aerodromes, that are required to be compatible with defined NVIS operations, must have controlled emissions in those visible and near infra-red regions of the spectrum that can interfere with the NVDs. Control is usually achievable by adding special filters to existing lights or by using lights with carefully controlled spectral emissions.*

4. *DASA has not yet recognised any standard or code applicable to Defence aerodromes that prescribe comprehensive NVIS design requirements. Designers must propose a standard / design requirements for Authority approval which provides a comprehensive basis for establishing the compatibility of aerodrome lighting systems with NVIS Friendly or Covert capability requirements.*

5. *While some standards may only require a ground test (or do not specify testing) to be conducted, flight test must be conducted to verify compliance with NVIS compatibility standards, particularly for helicopter NVIS operations.*

Superseded

6. *Before any solid state technology is selected for use with any lighting system on a Defence aerodrome where it represents a change from incandescent lighting technology, or a new system is being introduced (e.g. for an additional runway, taxiway or apron), including obstacle lighting on and around an aerodrome, the Aerodrome Operator and all applicable Military Air Operators must be consulted to ensure that the NVIS capability requirements (either NVIS Friendly or Covert) are established when considering:*

   i. *how the NVD will be utilised when operating from the aerodrome*

   ii. *expected visual guidance to be provided to the NVD by the aerodrome lighting system, and*

   iii. *implications of glare produced through their NVD.*

7. *Intensity settings below that of the lowest intensity setting used for normal visual guidance in accordance with MOS Part 139 (Aerodromes) may be applied to the aerodrome lighting as a whole, or any part of the aerodrome lighting, to suit the operational or training needs of any regular users of NVD at the aerodrome. For the purposes of this sub requirement, the requirements of paragraph 9.12(7) do not apply, and any 'NVD intensity setting' below the established minimum intensity setting for low intensity lighting is not to be considered as the minimum intensity for aerodrome visual lighting. Control of this 'NDV intensity setting' must be fully integrated into the aerodrome lighting control system and the details of these reduced settings and associated control must be fully documented either within the Aerodrome Manual directly, or by direct reference from the aerodrome design manual to relevant technical documentation held at the aerodrome.*

8. *Supplementary NVG/NVD/NVIS lighting applied in:*

   i. *positions that correspond with visible lighting positions, or*

   ii. *configurations that conform to operational requirements must not interfere with the configuration, operation of, or visual guidance provided by visible spectrum lighting.*

9. ***Guidance.** DEF-STAN 02-587 is the Authority prescribed standard for Shipborne Heliport aviation lighting. Whilst not developed for land based aerodromes, designers and Defence aerodrome project offices may benefit from an awareness and understanding of the documented concepts within the initial sections of the standard.*

(f) *Paragraph 9.12 (2) does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(g) *Paragraph 9.12 (7) may not apply as detailed in paragraph 11.e (8) above.*

(h) ***Chapter 9 Division 4 – Obstacle Lighting.** These requirements also apply to obstacles within the aerodrome's OLS, which extends outside the aerodrome. The Authority does not regulate obstacle lighting on obstacles outside the aerodrome. Where such lighting is required, the Authority will engage with Defence Estate Planning to engage with the relevant landowners. Knowledge of potential safety hazards associated with such obstacles is required for Defence to meet its statutory obligations to eliminate or otherwise minimise risks so far as is reasonably practicable.*

Superseded

(i) *Paragraph 9.31 (9)(b) does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(j) *Paragraph 9.36 does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(k) *Paragraph 9.46 T-VASIS and AT-VASIS. Given the revised requirements discussed at paragraph 11 (a) above, these requirements do not apply.*

(l) *Paragraph 9.47 Characteristics of T-VASIS Light Units. Given the revised requirements discussed at paragraph 11 (a) above, these requirements do not apply.*

(m) ***Chapter 9 Division 10 – Runway lights.*** *Runway lighting must meet the requirements in Chapter 9, Division 10, except for the following:*

1. ***Paragraph 9.51(13).*** *Replace this requirement with the following: If a runway is provided with circling guidance lights and high intensity runway lights, then the provisions of ICAO Annex 14 Volume 1 Section 5.3.6 and Part 4, Chapter 7 of the ICAO Aerodrome Design Manual (Doc 9157) must be met.*

2. ***Paragraph 9.53(1)(b).*** *Replace this requirement with the following: have a main beam that is directed towards the threshold.*

3. ***Paragraph 9.53(2).*** *Replace this requirement with the following: If circling guidance lights are used in conjunction with subsection (1), they must conform to subsection 9.51(13).*

4. ***Paragraph 9.59 (5)(e).*** *The first sentence in Note 3 does not apply.*

(n) ***Chapter 9 Division 11 – Taxiway lights.*** *Taxiway lighting must meet the requirements in Chapter 9, Division 12, except for the following:*

1. *Wherever possible, taxiway centreline lighting is preferred to taxiway edge lighting.*

2. ***Paragraph 9.78(3).*** *Replace this requirement with the following: Where additional visual cues are required to delineate apron edges at night, apron edge lighting may be provided to delineate the extremities of the apron area. Such lighting must comprise yellow lights, of no greater luminous intensity than the taxiway lights, regularly spaced at intervals not exceeding 30 m.*

3. ***Paragraph 9.88 (2).*** *For Defence aerodromes, C&SSPO must be consulted for details of the ILS critical and sensitive areas.*

4. ***Paragraph 9.93.*** *The requirements for the characteristics of apron edge lights must be met, except for the following:*

   i. *for the application of apron edge lighting only, replace paragraph 9.93(1)(c) with the following: 'show yellow'*

   ii. *for the application of apron edge lighting only, replace paragraph 9.93(1) (d) (ii) with the following: 'at all angles in azimuth necessary to provide guidance to the pilot of an aircraft on the apron'.*

(o) *Chapter 9 Division 12 – Apron Lights. Apron lighting must comply with the requirements set out in Chapter 9, Division 12, except for the following:*

Superseded

1. ***Paragraph 9.116(3)(a)(ii).*** *Replace this paragraph with the following: for vertical illuminance at a parking position with an aerodrome reference code letter - a minimum lux rating in accordance with Table 9.116 (3) for the code letter, at a height of 2 m above the apron in the relevant parking direction, along the aeroplane centreline over the entire length of the parking position.*

2. ***Paragraph 9.116(3)(b).*** *Replace this paragraph with the following: at an aircraft parking position not intended for air transport operations:*

   i. *a minimum lux rating for horizontal illuminance in accordance with Table 9.116 (3) for the code letter, with a uniformity ratio (average to minimum) of not more than 4:1*

   ii. *a minimum lux rating for vertical illuminance in accordance with Table 9.116 (3) for the code letter, at a height of 2 m above the apron in the relevant parking direction, along the aeroplane centreline over the entire length of the parking position.*

3. ***In addition to paragraph 9.116 (4)(a):*** *Verification test measurements must be taken and recorded using a grid with a maximum spacing of 5m between measuring points.*

4. ***In addition to paragraph 9.116 (4)(b):*** *Two averages must be measured, one for each of the opposing directions, using a maximum spacing of 5m between measuring points.*

5. ***In addition to paragraph 9.116 (4):*** *Add the following: (c) Vertical Illuminance Characteristics of a parking position: To confirm the characteristics of Vertical Illuminance lux levels across the entire parking position, design modelling and subsequent verification test measurements must be taken and recorded using a grid with a maximum spacing of 5m between measuring points. Two readings must be taken and recorded for each measuring point on the test grid and the two readings must be measured in the same opposing directions as detailed in MOS 139 Chapter 9, Division 12, Sub-regulation 9.116 (4)(b)(i)-(ii).*

(p) ***Paragraph 9.134 – Road and car park lighting.*** *Non aircraft guidance lighting on aerodromes or the surrounding Defence bases should be designed so that any resultant glare does not affect pilot visibility.*

(q) ***Emergency runways.*** *For emergency runways that are located on a continuous section of taxiway the:*

1. *threshold and end lights must be installed symmetrically about the runway centreline in two groups with the lights uniformly spaced in each group.*

2. *gap between the groups must be half the distance between the runway edge markings.*

Design element: Communication, Navigation, Surveillance (CNS) and Meteorological (MET) Facilities

2.12 ***Design requirement.*** *The design of CNS and MET facilities must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 19, except for the following:*

(a) ***Paragraph 19.01 (1).*** *The assessment must be undertaken by the Defence ANSP authorised to provide services on the aerodrome.*

Superseded

(b) *Paragraph 19.01 (2) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(c) ***Paragraphs 19.01 (3)(a) and (3)(d).*** *Advice must be sought from the Defence ANSP.*

(d) *Paragraphs 19.01 (3)(b) and (3)(c) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(e) ***Paragraphs 19.01 (4)(a) and (4)(c).*** *Advice must be sought from the Defence ANSP.*

(f) *Paragraph 19.01 (4)(b) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(g) *Paragraph 19.05 (2) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(h) *Paragraph 19.02 does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(i) ***Paragraphs 19.04 through 19.15.*** *The various assessments and other information should be sought from S&CSPO and the relevant Defence ANSP.*

(j) ***Paragraph 19.06 (2) Note 3.*** *The Aerodrome Operator should consult with the relevant ANSP.*

(k) ***Paragraph 19.17.*** *The assessment should be undertaken by the Bureau of Meteorology through the relevant Aerodrome Operator.*

Design element: Earthing points

2.13 ***Design requirement.*** *The design of earthing points must comply with the requirements of MOS 139 Aerodromes, Chapter 20, except for the following:*

(a) ***Paragraph 20.01 (1).*** *Ground earthing points must be installed at Defence aerodromes.*

(b) *Paragraphs 20.01 (2), (3) and (5) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(c) ***Paragraph 20.01 (4).*** *Earthing points must be marked with a white 45 cm diameter circle that includes the date of the next scheduled test. The white circle is to be enclosed by a 5 cm black ring.*

Design element: Light aircraft tie-down facilities

2.14 ***Design requirement.*** *The design of light aircraft tie-down facilities must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 21.*

Design element: Radio Communication Facilities

2.15 ***Design requirement.*** *The design of radio communication facilities must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 22, except for the following:*

(a) *Paragraphs 22.01(2)-(3) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

Superseded

(b) *Paragraphs 22.01 (6)-(8) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

Design element: Aerodromes Rescue and Fire Fighting Services

2.16 ***Design requirement.*** *The design of the facilities used in Aerodrome Rescue and Fire Fighting Services (ARFFS) must comply with the following MOS Part 139H requirements:*

(a) *Chapter 6, paragraph 6.1.3 Emergency Access Roads.*

(b) ***Facility sizing.*** *Each Defence aerodrome must store sufficient stocks of extinguishing agent and supply water to satisfy the performance criteria in Chapter 7. The facility must accommodate the required number of fire fighting vehicles and personnel to satisfy the requirements in Chapter 2 and Chapter 20.*

(c) *Chapter 22 ARFFS Facilities, except for the following:*

1. ***Paragraph 22.1.1.2.*** *Replace this paragraph with the following: The siting of a fire station facility must take into consideration the requirement of achieving the response times as defined in Chapter 6.*

2. ***Paragraph 22.1.1.3.*** *Replace this paragraph with the following: Fire stations must provide a Fire Station Communications Centre where all landings and take-offs of air transport aircraft are observed so as not to delay response times.*

3. *Paragraphs 22.1.2.7-8 do not contain facilities design requirements and are therefore not applicable to Defence aerodrome certification.*

4. *Paragraphs 22.1.4-8 do not contain facilities design requirements and are therefore not applicable to Defence aerodrome certification.*

(d) *Guidance on the design of fire stations is provided in the ICAO Airport Services Manual (Doc. 9137) Part 1 Chapter 9.*

INTRODUCTION

APPLICATION OF DESIGN REQUIREMENTS TO AERODROMES

INTRODUCTION

1.1 Defence aerodromes are used for the arrival, departure and surface movement of both fixed wing and rotary wing aircraft. Whilst inadequate aerodrome design has no impact on aircraft airworthiness, it can have a direct and substantial impact on safe flight operations. Consequently, Defence aerodromes are an integral part of the Defence Aviation Safety Program (DASP) and are managed under the Defence Aviation Safety Regulations (DASR). Defence aims to ensure that the design of Defence aerodromes aligns with reputable standards, supplemented for the Defence context. This provides a robust basis for certification of Defence aerodromes and assists Defence in meeting WHS obligations relating to aviation safety.

STRUCTURE

1.2 This section is divided into the following chapters:

(a) Chapter 1. This chapter establishes the context to support the understanding of the aerodrome design requirements detailed in each of the remaining chapters of this section.

(b) Chapter 2. This chapter details the design requirements for land based aerodromes intended primarily for use by fixed wing aircraft.

(c) Chapter 3. This chapter details the design requirements for land based heliports.

(d) Chapter 4. This chapter details the design requirements for shipborne heliports.

BASELINE AERODROME DESIGN STANDARDS

1.3 As discussed in Section 1 Chapter 1, the Authority has recognised a suite of baseline design requirements for the safe design of Defence aircraft. The Authority follows a similar approach for Defence aerodromes, and recognises a suite of baseline aerodrome design standards that provide a sound foundation for safe flight operations of aircraft at Defence aerodromes. These baseline aerodrome design standards are prescribed by an appropriate authority that is determined to reflect international good practice, are integrated, are internally consistent and are kept up-to-date by the sponsoring authority. The baseline aerodrome design standards provide the starting point for sourcing specific aerodrome design requirements.

1.4 The baseline aerodrome design standard for land based aerodromes and land based heliports are:

(a) Land based aerodromes. The Civil Aviation Safety Authority (CASA) Part 139 (Aerodromes) Manual of Standards 2019 (MOS Part 139) (September 2019), including the MOS Part 139H - Standards Applicable to the Provision of Aerodrome Rescue and Fire Fighting Services (MOS Part 139H) (January 2005).

Superseded

(b) Land based heliports. International Civil Aviation Organisation (ICAO) Annex 14 Aerodromes Volume 2 Heliports (July 2013, inclusive of amendments 6, 7 and 8 – Nov 2018).

1.5 Several different baseline aerodrome standards were used for shipborne heliports. These standards were selected and supplemented by the Authority, where needed, to develop the Australian Defence Force Maritime Materiel Requirements Set - DEF (AUST) 5000 - Volume 11 Ship Aviation Requirements (November 2017) for the Royal Australian Navy (RAN).

AERODROME DESIGN ELEMENTS

1.6 The baseline aerodrome standards adopted for Defence aerodrome certification comprise of a variety of design requirements and related matters, some of which are not within scope of this section. This section only provides aerodrome design requirements for physical design elements rather than design processes, maintenance requirements and operational requirements. Further, design elements are only included within this section where their design requirements form effective treatments to aerodrome-related aviation safety risks. The design elements used in this section, for both fixed wing and rotary wing operations, are listed in Annex A.

SUPPLEMENTATION OF BASELINE AERODROME DESIGN STANDARDS

1.7 Where required, the Authority varies or prescribes supplementation to the baseline design standards for specific aerodrome design elements. The variation or supplementation is made to specifically address situations where:

(a) the baseline standard is silent on specific design elements needed for Defence aerodromes, such as military-specific aerodrome design requirements.

(b) the baseline standard provides requirements for a specific aerodrome design element, but Defence experience has unequivocally demonstrated that these aerodrome design requirements need to be varied or supplemented when applied to Defence aerodromes.

(c) the baseline standard requirements need to be supplemented by mandatory Australian legislative design requirements, such as for electrical wiring.

1.8 Variation or supplementation is only made where there is no conflict with the baseline standard requirements for other design elements (given that the baseline standard comprises an integrated set of requirements).

ESSENTIAL VS RECOMMENDED DESIGN REQUIREMENTS

1.9 In the context of airworthiness design requirements, Section 1 Chapter 1 distinguishes between 'essential' and 'recommended' design requirements. While 'essential' design requirements are well defined in safety legislation and Defence policy and/or operational regulation requirements, 'recommend' design requirements represent 'good practice' that is not yet widely accepted/ implemented. In the aerodrome context, all design requirements prescribed in this section are considered to fall into the 'essential' category. Nevertheless, many of the requirements only apply in specific circumstances, so many aerodromes will never be required to contain all the design features described in the baseline aerodrome design standards. The set of applicable aerodrome design requirements for a given Defence aerodrome, must be agreed to by the Authority as part of an aerodrome certification program.

Superseded

APPLICATION OF DESIGN REQUIREMENTS TO CERTIFIED AERODROMES

1.10 The aerodrome design requirements detailed in Chapters 2, 3 and 4 of this section apply to those Defence aerodromes which require Defence certification in accordance with DASR.139 - Aerodromes. The design requirements may be applied to other Defence aerodromes, as a treatment for those assessed risks that warrant more rigorous design requirements.

RELATIONSHIP TO OTHER SPONSORED DOCUMENTS

1.11 Whilst the following chapters in this section provide aviation safety-related aerodrome design requirements, they do not include non-aviation safety-related design requirements necessary for Defence capability, standardisation and interoperability with other defence forces.

1.12 For land based aerodromes and land based heliports, these requirements are detailed in various documents sponsored by the Directorate of Estate Engineering Policy (DEEP) within E&IG's Estate Engineering Governance and Integrity System (EEGIS). Collectively, the EEGIS documents are the repository for Defence's corporate solution to the design of land based aerodromes and land based heliports, documenting all the requirements necessary for Defence aerodromes to be operated safely and efficiently, and to allow effective force projection. For those design requirements relevant to aviation safety, the EEGIS documents refer to this section of the DASDRM.

1.13 For shipborne heliports, the non-aviation safety-related requirements are captured within the same document as the aviation safety-related aerodrome design requirements, that is, the DEF (AUST) 5000 - Volume 11 Ship Aviation Requirements (November 2017).

1.14 An aerodrome Certification Basis (CB) is required for each aerodrome requiring certification. While Defence's collective aerodrome design requirements comprise both those related to aviation safety (prescribed in this section) and those related to capability/interoperability (documented in the EEGIS), the aerodrome CB will only comprise of those design requirements necessary to demonstrate that the aerodrome can support safe flight operations; i.e. applicable requirements prescribed by the Authority in this section. Assessment of the design for the issue of an Aerodrome Certificate will only be performed against the requirements of the aerodrome CB.

ENGAGEMENT WITH DASA

1.15 The recognised baseline standards used in this section, occasionally identify a requirement to engage with designated authorities or other organisations. Where such a requirement is identified, except where expressly detailed in Chapter 2 and Chapter 3 of this section, readers are to engage with the DASA.

Annex:

A. Aerodrome Design Elements

Superseded

AERODROME DESIGN REQUIREMENTS

LAND-BASED AERODROMES

INTRODUCTION

2.1 This chapter details the design requirements for land based aerodromes primarily used by fixed wing aircraft. However, where applicable, it also contains design requirements for integrating rotary wing operations into these aerodromes.

2.2 Baseline design standards for land based aerodromes are contained in the CASA Part 139 (Aerodromes) Manual of Standards 2019 (MOS Part 139) (September 2019) and the MOS Part 139H - Standards Applicable to the Provision of Aerodrome Rescue and Fire Fighting Services (MOS Part 139H) (January 2005). Where required, the Authority varies or prescribes supplementation to the baseline design standards for specific aerodrome design elements.

2.3 Where reference is made to CASA, within both the MOS Part 139 and the MOS Part 139H, consultation should be undertaken with the DASA if there is any ambiguity, or further clarification required in implementing these requirements. No consultation or contact with CASA should occur.

2.4 Where the CASA term 'air transport operation' is used within both the MOS Part 139 and the MOS Part 139H, it is to be interpreted as follows:
Air transport operation means a passenger transport operation, a cargo transport operation or a medical transport operation.

AERODROME DESIGN REQUIREMENTS

2.5 The aerodrome design requirements and the associated variations and supplementations defined by the Authority for each of the identified design elements detailed in Chapter 1 Annex A of this section, are described below.

Design element: Physical characteristics of movement facilities

2.6 Design requirements. The design of the physical characteristics of movement facilities, such as runways, ground movement, parking and loading areas, must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 6, except for the following:

(a) *Paragraph 6.01 (6) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(b) ***Division 1 Runways – Application to emergency runways.*** *Where only one runway is available on an aerodrome used regularly by fighter jets, an emergency runway may be required. If required, this emergency runway, which must be located on a specified taxiway, must meet the following design criteria:*

1. ***Runway width.*** *The taxiway on which the emergency runway is situated, must meet at least the requirements of a code 2B runway with Outer Main Gear Wheel Span of 4.5m up to but not including 6m. That is, the minimum width must be 23m.*

Superseded

2. ***Strip width.*** *In accordance with an Aerodrome Reference Code (ARC) code number 2B non-instrument approach, the emergency runway strip must have a minimum width of 80m, centred on the taxiway.*

3. ***RESA.*** *A Runway End Safety Area (RESA) of 60m must be present at each end of the emergency runway.*

(c) ***Section 6.09 Runway surface.*** *The following variations to the MOS Part 139 (Aerodromes) requirements for runway surfaces apply:*

1. *Paragraphs 6.0.9 (2), (3) and (6) contain maintenance verification requirements rather than design requirements and are therefore not applicable to Defence aerodrome certification.*

2. *Paragraph 6.09 (5) applies to all Defence certified aerodromes.*

3. ***Surfaces near aircraft arresting systems.*** *The runway surface within 60m of an aircraft arresting system, on both the approach and departure sides, must satisfy the requirements of UFC 3-260-01 Airfield and Heliport Planning and Design, section 3-17.2.2, as they apply to USAF aerodromes.*

4. *Skid resistance for taxiways used as emergency runways must be considered during design and recorded at construction and after any major surface treatment.*

(d) *Paragraph 6.22 (2) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(e) *Paragraph 6.25 does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(f) *Paragraph 6.26 (3) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(g) ***Division 4 - Application to military aprons.*** *The MOS 139 requirements for aprons do not directly account for military special-purpose aprons, namely Operational Readiness Platforms (ORP), Explosive Ordnance Loading Aprons (EOLA) and Quick Reaction Alert Facilities (QRAF). In designing new military specific aprons or modifying existing aprons, the following Defence aerodrome requirements apply. Where the Authority prescribed requirements in this section conflict with the MOS 139 requirements, the requirements below take precedence.*

1. ***Design requirements - ORP.*** *ORPs must comply with the design requirements detailed in UFC 3-260-01, 6-8, Warm-Up Pad.*

2. ***Design requirements - EOLAs.*** *EOLAs must comply with the design requirements detailed in UFC 3-260-01, 6-10 Arm/Disarm Pads. The Director of Ordnance Safety (DOS) must be consulted on defining tailoring of these requirements for a specific aerodrome.*

3. ***Design requirements - QRAF.*** *QRAFs must comply with the design requirements detailed in UFC 3-260-01, 6-13 Alert Pad.*

Design element: Aircraft arresting systems

2.7 Where an aerodrome, to be frequently used by high-speed jet aircraft, cannot be designed to include adequate Runway End Safety Areas (RESA), an Aircraft Arresting System (AAS) is required to

Superseded

recover (stop) an aircraft during an emergency landing or an aborted take-off. AAS types that may be used on Defence aerodromes are:

(a) aircraft arresting barriers, which engage and absorb the forward momentum of an aircraft by means of a net; and

(b) hookcable AAS, which engage hook-equipped aircraft and absorb forward momentum by means of a cable deployed across the runway.

2.8 ***Design requirement.*** *The AAS design must comply with the requirements of UFC 3-260-01 Airfield and Heliport Planning and Design, section 3-17, Aircraft Arresting Systems, except for the following:*

(a) ***Paragraph 3.17.1.*** *The requirements applicable to USN and Marine Corps AAS are not applicable.*

(b) *AAS must be designed and sited so that they do not compromise broader MOS 139 design requirements. To avoid AAS becoming obstacles to air navigation, AAS 'huts' must be located outside the graded portion of the runway strip.*

Design element: Obstacle restrictions and limitations

2.9 ***Design requirement.*** *The design of obstacle restrictions and limitations must comply with the requirements of MOS Part 139 (Aerodromes) Chapter 7, except for the following:*

(a) ***Paragraph 7.01(2).*** *Obstacle data requirements must be obtained from AIS-AF, as the relevant Air Navigation Service Provider (ANSP).*

(b) ***Paragraph 7.02(1).*** *Objects or structures, other than approved visual and navigational aids or Aircraft Arrestor Systems, must not be constructed or erected within the obstacle restriction area of an aerodrome without the written approval of the Authority. When making a determination on whether objects or structures should be considered an obstacle, the Authority will seek advice from E&IG Estate Planning – Land Planning.*

(c) ***Paragraph 7.03(4) Note.*** *E&IG Estate Planning – Land Planning will provide advice to the Authority on development requests for buildings and other infrastructure to be built in the obstacle limitation surface of Defence aerodromes, beyond the aerodrome boundary.*

(d) *Paragraphs 7.18-25 do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(e) ***Emergency runways.*** *Emergency runways must meet ARC code 2B non-instrument approach OLS requirements.*

Design element: Visual Aids Provided by Aerodrome Markings, Markers, Signals, Signs, Wind Direction Indicators, and so on

2.10 ***Design requirement.*** *The design of visual aids provided by aerodrome markings, markers, signals, signs, wind direction indicators and so on must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 8, except for the following:*

(a) ***Paragraph 8.27(3).*** *The provision of Runway Threshold Identification Lights is optional.*

(b) *Paragraph 8.29 (1)(b) and (3)(b) are not applicable to Defence aerodrome certification.*

(c) *Paragraph 8.30 (1)(a) is not applicable to Defence aerodrome certification.*

Superseded

(d) ***Figure 8.31 (2)-2 through 5.*** *Requirements relevant to international air transport operations are not applicable to Defence aerodrome certification.*

(e) *Paragraph 8.38 Note is not applicable to Defence aerodrome certification.*

(f) *Paragraph 8.79 (4)(a) is not applicable to Defence aerodrome certification.*

(g) ***Paragraph 8.79 (7).*** *Consultation should occur with the relevant Military Air Operators. For a Defence Aerodrome where there is a Joint User Deed or a lease, there is also a requirement to consult with the joint user or leased operator.*

(h) *Paragraph 8.85 (1)(a) and (2)(a) are not applicable to Defence aerodrome certification.*

(i) ***Paragraph 8.93 MAGS with information.*** *An additional common military information sign is TACAN.*

(j) *Paragraph 8.109 (4) does not contain aerodrome design requirements and is therefore not applicable to Defence aerodrome certification.*

(k) ***Division 12 Helicopter areas on aerodromes****. The dimensions discussed in Division 12 are based on consideration of single-main-rotor helicopters. For helicopter areas designed to accommodate tandem-rotor helicopters, the design will be determined by analysis on a case-by-case basis for the specific model(s) of helicopter(s), incorporating clearances for safety, including the basic requirement for a safety area and specified protection areas. For the appropriate safety clearances for Chinook CH-47, the Type 1 parking requirements detailed in Figure 6.6 of UFC 3-260-01 (4 Feb 19) must be met.*

(l) ***Emergency runways.*** *An end bar and Permanent Survey Mark must be placed at each end of the emergency runway. The end bar is to be white and 0.45m thick. No other runway markings are required but additional markings may be applied if required by aerodrome stakeholders.*

(m) ***Distance to run markers.*** *With the exception of multi-lane runways, sealed runways are to be equipped with distance to run marker boards. As illustrated in Annex A, the markers must:*

1. *be sited on both sides of each sealed runway*
2. *indicate the runway distance remaining in thousands of feet (the last three digits being omitted)*
3. *be numbered from the upwind end of the runway, increasing towards the beginning of the runway, the figure `1' being 1 000 feet from the upwind end*
4. *be mounted vertically at right angles to the longitudinal axis of the runway and 18 m from the runway edge*
5. *be displaced 100 feet from their true position if it coincides with a taxiway intersection (or may be omitted if the 100 feet displacement is insufficient)*
6. *be not less than 15 m from the edge of a taxiway*
7. *account for the length of the runway being other than a multiple of 1 000 feet. Half the odd length must be used at each end of the runway for computing the position of the markers. For example, runway length = 9800 feet, odd length = 800 feet, DTRM Board `1' = 1400 feet from each up wind end.*

(n) ***Distance to run marker board design.*** *Marker boards must be designed so that they:*

Superseded

1. *measure 1.8 m in height and 1.2 m in width*

2. *display numbers 1.5 m in height, 0.9 m in breadth with a stroke of 13 cm*

3. *display white numbers on a black background*

4. *are of frangible construction to reduce aircraft damage should impact occur*

5. *are illuminated to ensure readability at night and in adverse weather conditions.*

(o) ***Hookcable markers.*** *On runways where hookcable AAS are installed, the position of the hookcable AAS is to be indicated by illuminated hookcable marker boards. As illustrated in Annex B, the markers must be:*

1. *placed on both sides of the runway in line with the hookcable pendant and equidistant from the runway centre line*

2. *positioned between 15 m and 23 m from the edge of the full strength pavement.*

(p) ***Hookcable marker board design.*** *The hookcable marker boards must be designed so that they:*

1. *comprise a yellow or orange disc one metre in diameter on a black background*

2. *are visible for both runway directions*

3. *are of frangible construction to reduce aircraft damage should impact occur*

4. *are illuminated to ensure readability at night and in adverse weather.*

(q) ***Hookcable runway markings.*** *On runways equipped with hookcable AAS, arresting system warning markings must be displayed on the runway at the point where the hookcable crosses the runway. The markings consist of a line of solid yellow circles 3 m in diameter located as shown at Annex C.*

(r) ***Navigation check point sign.*** *A Navigation check point sign must be installed on the approach taxiway leading onto the threshold of a runway at airfields where a navigation facility is installed. The sign is to identify itself as a 'TACAN CHECK' or 'POSITION CHECK' and provide information for the respective navigational aid. Further detail of pavement marking and sign detail is provided at Annex D.*

Design element: Visual aids provided by aerodrome lighting

2.11 ***Design requirement.*** *The design of aerodrome lighting must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 9, except for the following:*

(a) ***Paragraph 9.01 (3).*** *VASIS must be provided for all Defence certified aerodromes; however, T-VASIS and AT-VASIS are not acceptable design solutions. Double-sided PAPI should be installed, except where impractical to do so due to geometric constraints. In these situations a single-sided PAPI must be installed.*

(b) ***Paragraph 9.04 (4)(f).*** *Defence also considers taxiway routes, for operations in conditions less than 800 m, to be essential.*

(c) *Paragraph 9.06 does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

Superseded

(d) *Paragraph 9.07 (3)-(6) do not include design requirements and are therefore not applicable to Defence aerodrome certification.*

(e) ***Paragraph 9.10.*** *In addition to the MOS Part 139 (Aerodromes) defined requirements for visual aids provided by aerodrome lighting:*

1. *Where Defence aerodromes are required to provide lighting to support aircraft operating with Night Vision systems (known as Night Vision Imaging System (NVIS), Night Vision Device (NVD) or Night Vision Goggles (NVG)), the aerodrome lighting systems must satisfy compatibility requirements for the relevant Night Vision Imaging System (NVIS) Type and Class specified in use by all relevant aircraft. The aircraft systems NVIS Type and Class must align with those defined within DASDRM Section 3 Chapter 7.*

2. *The required capability for the Defence aerodrome must be defined and may be either 'Friendly' to NVIS operations or 'Covert'. Friendly is defined as 'NVD/NVG/NVIS Friendly - Lights that are specifically designed or adapted to be visible to both the unaided eye and to Night Vision Devices (NVDs), but which do not degrade, or minimally degrade, the performance of the NVDs in operational use.' Covert is defined as 'Covert - Lights that are designed to be invisible to the unaided eye but that are visible through NVDs.'*

3. *Lighting at aerodromes, that are required to be compatible with defined NVIS operations, must have controlled emissions in those visible and near infra-red regions of the spectrum that can interfere with the NVDs. Control is usually achievable by adding special filters to existing lights or by using lights with carefully controlled spectral emissions.*

4. *DASA has not yet recognised any standard or code applicable to Defence aerodromes that prescribe comprehensive NVIS design requirements. Designers must propose a standard / design requirements for Authority approval which provides a comprehensive basis for establishing the compatibility of aerodrome lighting systems with NVIS Friendly or Covert capability requirements.*

5. *While some standards may only require a ground test (or do not specify testing) to be conducted, flight test must be conducted to verify compliance with NVIS compatibility standards, particularly for helicopter NVIS operations.*

6. *Before any solid state technology is selected for use with any lighting system on a Defence aerodrome where it represents a change from incandescent lighting technology, or a new system is being introduced (e.g. for an additional runway, taxiway or apron), including obstacle lighting on and around an aerodrome, the Aerodrome Operator and all applicable Military Air Operators must be consulted to ensure that the NVIS capability requirements (either NVIS Friendly or Covert) are established when considering:*

   i. *how the NVD will be utilised when operating from the aerodrome*

   ii. *expected visual guidance to be provided to the NVD by the aerodrome lighting system, and*

   iii. *implications of glare produced through their NVD.*

7. *Intensity settings below that of the lowest intensity setting used for normal visual guidance in accordance with MOS Part 139 (Aerodromes) may be applied to the aerodrome lighting as a whole, or any part of the aerodrome lighting, to suit the*

Superseded

operational or training needs of any regular users of NVD at the aerodrome. For the purposes of this sub requirement, the requirements of paragraph 9.12(7) do not apply, and any 'NVD intensity setting' below the established minimum intensity setting for low intensity lighting is not to be considered as the minimum intensity for aerodrome visual lighting. Control of this 'NDV intensity setting' must be fully integrated into the aerodrome lighting control system and the details of these reduced settings and associated control must be fully documented either within the Aerodrome Manual directly, or by direct reference from the aerodrome design manual to relevant technical documentation held at the aerodrome.

8. *Supplementary NVG/NVD/NVIS lighting applied in:*

   i. *positions that correspond with visible lighting positions, or*

   ii. *configurations that conform to operational requirements must not interfere with the configuration, operation of, or visual guidance provided by visible spectrum lighting.*

9. ***Guidance.*** *DEF-STAN 02-587 is the Authority prescribed standard for Shipborne Heliport aviation lighting. Whilst not developed for land based aerodromes, designers and Defence aerodrome project offices may benefit from an awareness and understanding of the documented concepts within the initial sections of the standard.*

(f) *Paragraph 9.12 (2) does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(g) *Paragraph 9.12 (7) may not apply as detailed in paragraph 11.e (8) above.*

(h) ***Chapter 9 Division 4 – Obstacle Lighting.*** *These requirements also apply to obstacles within the aerodrome's OLS, which extends outside the aerodrome. The Authority does not regulate obstacle lighting on obstacles outside the aerodrome. Where such lighting is required, the Authority will engage with Defence Estate Planning to engage with the relevant landowners. Knowledge of potential safety hazards associated with such obstacles is required for Defence to meet its statutory obligations to eliminate or otherwise minimise risks so far as is reasonably practicable.*

(i) *Paragraph 9.31 (9)(b) does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(j) *Paragraph 9.36 does not include design requirements and is therefore not applicable to Defence aerodrome certification.*

(k) *Paragraph 9.46 T-VASIS and AT-VASIS. Given the revised requirements discussed at paragraph 11 (a) above, these requirements do not apply.*

(l) *Paragraph 9.47 Characteristics of T-VASIS Light Units. Given the revised requirements discussed at paragraph 11 (a) above, these requirements do not apply.*

(m) ***Chapter 9 Division 10 – Runway lights.*** *Runway lighting must meet the requirements in Chapter 9, Division 10, except for the following:*

1. ***Paragraph 9.51(13).*** *Replace this requirement with the following: If a runway is provided with circling guidance lights and high intensity runway lights, then the provisions of ICAO Annex 14 Volume 1 Section 5.3.6 and Part 4, Chapter 7 of the ICAO Aerodrome Design Manual (Doc 9157) must be met.*

Superseded

2. ***Paragraph 9.53(1)(b).*** *Replace this requirement with the following: have a main beam that is directed towards the threshold.*

3. ***Paragraph 9.53(2).*** *Replace this requirement with the following: If circling guidance lights are used in conjunction with subsection (1), they must conform to subsection 9.51(13).*

4. ***Paragraph 9.59 (5)(e).*** *The first sentence in Note 3 does not apply.*

(n) ***Chapter 9 Division 11 – Taxiway lights.*** *Taxiway lighting must meet the requirements in Chapter 9, Division 12, except for the following:*

1. *Wherever possible, taxiway centreline lighting is preferred to taxiway edge lighting.*

2. ***Paragraph 9.78(3).*** *Replace this requirement with the following: Where additional visual cues are required to delineate apron edges at night, apron edge lighting may be provided to delineate the extremities of the apron area. Such lighting must comprise yellow lights, of no greater luminous intensity than the taxiway lights, regularly spaced at intervals not exceeding 30 m.*

3. ***Paragraph 9.88 (2).*** *For Defence aerodromes, C&SSPO must be consulted for details of the ILS critical and sensitive areas.*

4. ***Paragraph 9.93.*** *The requirements for the characteristics of apron edge lights must be met, except for the following:*

   i. *for the application of apron edge lighting only, replace paragraph 9.93(1)(c) with the following: 'show yellow'*

   ii. *for the application of apron edge lighting only, replace paragraph 9.93(1) (d) (ii) with the following: 'at all angles in azimuth necessary to provide guidance to the pilot of an aircraft on the apron'.*

(o) *Chapter 9 Division 12 – Apron Lights. Apron lighting must comply with the requirements set out in Chapter 9, Division 12, except for the following:*

1. ***Paragraph 9.116(3)(a)(ii).*** *Replace this paragraph with the following: for vertical illuminance at a parking position with an aerodrome reference code letter - a minimum lux rating in accordance with Table 9.116 (3) for the code letter, at a height of 2 m above the apron in the relevant parking direction, along the aeroplane centreline over the entire length of the parking position.*

2. ***Paragraph 9.116(3)(b).*** *Replace this paragraph with the following: at an aircraft parking position not intended for air transport operations:*

   i. *a minimum lux rating for horizontal illuminance in accordance with Table 9.116 (3) for the code letter, with a uniformity ratio (average to minimum) of not more than 4:1*

   ii. *a minimum lux rating for vertical illuminance in accordance with Table 9.116 (3) for the code letter, at a height of 2 m above the apron in the relevant parking direction, along the aeroplane centreline over the entire length of the parking position.*

3. ***In addition to paragraph 9.116 (4)(a):*** *Verification test measurements must be taken and recorded using a grid with a maximum spacing of 5m between measuring points.*

Superseded

4. ***In addition to paragraph 9.116 (4)(b):*** *Two averages must be measured, one for each of the opposing directions, using a maximum spacing of 5m between measuring points.*

5. ***In addition to paragraph 9.116 (4):*** *Add the following: (c) Vertical Illuminance Characteristics of a parking position: To confirm the characteristics of Vertical Illuminance lux levels across the entire parking position, design modelling and subsequent verification test measurements must be taken and recorded using a grid with a maximum spacing of 5m between measuring points. Two readings must be taken and recorded for each measuring point on the test grid and the two readings must be measured in the same opposing directions as detailed in MOS 139 Chapter 9, Division 12, Sub-regulation 9.116 (4)(b)(i)-(ii).*

(p) ***Paragraph 9.134 – Road and car park lighting.*** *Non aircraft guidance lighting on aerodromes or the surrounding Defence bases should be designed so that any resultant glare does not affect pilot visibility.*

(q) ***Emergency runways.*** *For emergency runways that are located on a continuous section of taxiway the:*

1. *threshold and end lights must be installed symmetrically about the runway centreline in two groups with the lights uniformly spaced in each group.*

2. *gap between the groups must be half the distance between the runway edge markings.*

Design element: Communication, Navigation, Surveillance (CNS) and Meteorological (MET) Facilities

2.12 ***Design requirement.*** *The design of CNS and MET facilities must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 19, except for the following:*

(a) ***Paragraph 19.01 (1).*** *The assessment must be undertaken by the Defence ANSP authorised to provide services on the aerodrome.*

(b) *Paragraph 19.01 (2) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(c) ***Paragraphs 19.01 (3)(a) and (3)(d).*** *Advice must be sought from the Defence ANSP.*

(d) *Paragraphs 19.01 (3)(b) and (3)(c) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(e) ***Paragraphs 19.01 (4)(a) and (4)(c).*** *Advice must be sought from the Defence ANSP.*

(f) *Paragraph 19.01 (4)(b) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(g) *Paragraph 19.05 (2) does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(h) *Paragraph 19.02 does not contain design requirements and is therefore not applicable to Defence aerodrome certification.*

(i) ***Paragraphs 19.04 through 19.15.*** *The various assessments and other information should be sought from S&CSPO and the relevant Defence ANSP.*

(j) ***Paragraph 19.06 (2) Note 3.*** *The Aerodrome Operator should consult with the relevant ANSP.*

Superseded

(k) ***Paragraph 19.17.*** *The assessment should be undertaken by the Bureau of Meteorology through the relevant Aerodrome Operator.*

Design element: Earthing points

2.13 ***Design requirement.*** *The design of earthing points must comply with the requirements of MOS 139 Aerodromes, Chapter 20, except for the following:*

(a) ***Paragraph 20.01 (1).*** *Ground earthing points must be installed at Defence aerodromes.*

(b) *Paragraphs 20.01 (2), (3) and (5) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(c) ***Paragraph 20.01 (4).*** *Earthing points must be marked with a white 45 cm diameter circle that includes the date of the next scheduled test. The white circle is to be enclosed by a 5 cm black ring.*

Design element: Light aircraft tie-down facilities

2.14 ***Design requirement.*** *The design of light aircraft tie-down facilities must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 21.*

Design element: Radio Communication Facilities

2.15 ***Design requirement.*** *The design of radio communication facilities must comply with the requirements of MOS Part 139 (Aerodromes), Chapter 22, except for the following:*

(a) *Paragraphs 22.01(2)-(3) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

(b) *Paragraphs 22.01 (6)-(8) do not contain design requirements and are therefore not applicable to Defence aerodrome certification.*

Design element: Aerodromes Rescue and Fire Fighting Services

2.16 ***Design requirement.*** *The design of the facilities used in Aerodrome Rescue and Fire Fighting Services (ARFFS) must comply with the following MOS Part 139H requirements:*

(a) *Chapter 6, paragraph 6.1.3 Emergency Access Roads.*

(b) ***Facility sizing.*** *Each Defence aerodrome must store sufficient stocks of extinguishing agent and supply water to satisfy the performance criteria in Chapter 7. The facility must accommodate the required number of fire fighting vehicles and personnel to satisfy the requirements in Chapter 2 and Chapter 20.*

(c) *Chapter 22 ARFFS Facilities, except for the following:*

1. ***Paragraph 22.1.1.2.*** *Replace this paragraph with the following: The siting of a fire station facility must take into consideration the requirement of achieving the response times as defined in Chapter 6.*

2. ***Paragraph 22.1.1.3.*** *Replace this paragraph with the following: Fire stations must provide a Fire Station Communications Centre where all landings and take-offs of air transport aircraft are observed so as not to delay response times.*

3. *Paragraphs 22.1.2.7-8 do not contain facilities design requirements and are therefore not applicable to Defence aerodrome certification.*

Superseded

4. *Paragraphs 22.1.4-8 do not contain facilities design requirements and are therefore not applicable to Defence aerodrome certification.*

(d) *Guidance on the design of fire stations is provided in the ICAO Airport Services Manual (Doc. 9137) Part 1 Chapter 9.*

Annexes:

A. Distance to Run Marker Siting

B. Hookcable Marker Siting

DEFENCE LAND-BASED HELIPORTS

INTRODUCTION

3.1 This chapter details the design requirements for land-based heliports used solely for rotary wing operations. Such heliports do not form part of a larger aerodrome that is primarily used by fixed wing aircraft. For the design requirements for integrating rotary wing operations into these fixed-wing aerodromes, refer to Chapter 2 of this section.

3.2 Land-based heliports range from a single-spot Helicopter Landing Site (HLS), with a suitable Final Approach and Take-Off Area (FATO), through to large rotary wing aerodromes with multiple integrated FATOs, extensive aprons and several helicopter runways and air/ground taxiways. The intent of this chapter is to provide design requirements for all types of heliports, in a form that is scalable depending on the capability requirement.

3.3 The primary design standard for land-based heliports is the International Civil Aviation Organisation (ICAO) Annex 14 Aerodromes Volume II Heliports Edition 5. Where necessary, this standard is supplemented or replaced by other requirements, such as those detailed in US Department of Defense Unified Facilities Criteria (UFC) 3-260-01 Airfield and Heliport Planning and Design.

3.4 For some design elements, ICAO Annex 14 Volume II Edition 5 makes reference to relevant sections of ICAO Annex 14 Volume I. Where such references are made, they have sometimes been replaced by reference to the requirements for land based aerodromes, previously detailed in Chapter 2 of this section.

3.5 The DASA should be consulted to resolve any ambiguity, or if further clarification is required in implementing these requirements.

HELIPORT DESIGN REQUIREMENTS

3.6 The land-based heliport design requirements and the associated variations and supplementations defined by the Authority for each of the identified design elements detailed in Chapter 1 annex A of this section, are described below.

Design element: Physical characteristics of movement facilities

3.7 The number, location and required functionality of movement facilities[1] to be included on a Defence heliport are capability decisions to be made in accordance with Defence's capability planning processes. For example, the number of required FATOs, whether they are runway-type or spot-type, and their required capability, depends on their intended use. Different FATOs may be required for regular operations, test/maintenance check flights, for the hook-up of external lift/underslung loads, SAR/crash response and other activities.

Superseded

3.8 ***Design requirement.*** *Having made these capability decisions, the design of the physical characteristics of these movement facilities must comply with the relevant requirements of ICAO Annex 14, Volume II, Edition 5, Section 3.1 Onshore Heliports, except for the following:*

(a) ***Final Approach and Take-Off Areas.*** *For paragraph 3.1.3, where a FATO is to be located on a runway, the 'rotary-wing runway' must satisfy the US Army requirements of UFC 3-260-01 sections 4-3.2 and 4-3.3, with the following exceptions:*

1. *For performance Class 1 operations the approach and departure path slope must be 1:22 rather than the 1:8 slope detailed in Figure 4-1.*

2. *The references in section 4-3.3 to the clear zones detailed in Figure 4-3 do not apply.*

(b) ***Touchdown and Lift-Off Areas (TLOF).*** *The requirements in paragraphs 3.1.21-24 and 3.1.26-31 must be supplemented by the US Army dimensional requirements in UFC 3-260-01 section 4-4.6 Dimensional Criteria. To the extent that the grade requirements conflict, the ICAO requirements prevail. Paragraphs 3.1.25 and 3.1.32 are not relevant to Defence heliport certification.*

(c) ***Helicopter clearways.*** *The requirements in paragraphs 3.1.16-20 must be supplemented by the US Army requirements within UFC 3-260-01 section 4-11 Overruns for Rotary-Wing Runways and Landing Lanes.*

(d) ***Mobile objects.*** *The comments about 'mobile object' in paragraphs 3.1.10/37/53 do not contain design requirements and are therefore not applicable to Defence heliport design.*

(e) ***Taxiways and taxiroutes.*** *Note 3 above paragraph 3.1.33 is not relevant to Defence heliport design. The requirements in paragraphs 3.1.33-43 must be supplemented by the US Army dimensional requirements in UFC 3-260-01 section 5-6 Rotary-Wing Taxiway Dimensions. To the extent that the grade requirements conflict, the ICAO requirements prevail.*

(f) ***Helicopter stands.*** *The requirements in paragraphs 3.1.44-55 must be supplemented by the requirements detailed in UFC 3-260-01 Section 6-7 Parking Apron for Rotary-Wing Aircraft. This section provides the layout and parking separation distances for both single-main-rotor and tandem-rotor helicopters. The Type 1 parking configuration is to be applied within Defence heliports given that the Type 2 configuration may create refuelling problems. Paragraph 6-7.6.1.1 of UFC 3-260-01 is not relevant to Defence heliport certification.*

(g) ***Rotary-Wing Landing Lanes.*** *Landing lanes are a military concept that allow numerous simultaneous launch and recovery operations. Any landing lanes to be included in Defence heliports are to comply with the requirements in UFC 3-260-01 Section 4-8 Rotary-Wing Landing Lanes. To the extent that these requirements conflict with ICAO FATO/TLOF requirements, the ICAO requirements prevail.*

(h) ***Overruns for rotary-wing runways and landing lanes.*** *Overruns are required at the end of all rotary-wing runways and landing lanes in accordance with the requirements in UFC 3-260-01 Section 4-11 Overruns for Rotary-Wing Runways and Landing Lanes. The Air Force/Army dimensions must be used in Item 2 of Table 4-5.*

(i) ***Clear Zone and Accident Prevention Zone.*** *A Clear Zone and Accident Prevention Zone are required under the rotary-wing approach-departure surface, in accordance with the requirements in UFC 3-260-01 Section 4-12 Clear Zone and Accident Prevention Zone (APZ). Comments in paragraph 4-12.1, 4-12.2 and Table 4-6 about land ownership are not relevant to Defence heliports.*

Superseded

Design element: Aircraft arresting systems

3.9 This design element is not relevant to Defence heliport certification.

Design element: Obstacle restriction and limitation

3.10 ***Design requirement.*** *The design of obstacle restrictions and limitations must comply with the requirements of ICAO Annex 14, Volume II, Edition 5, Chapter 4 Obstacle Environment, except for the following:*

(a) ***Paragraph 4.1.11.*** *The appropriate authority mentioned in Note 1 is the DASA.*

(b) *Paragraphs 4.1.22 through 26 are not relevant to Defence heliport certification.*

(c) *Figure 4-3 Note 2 does not contain design requirements and is therefore not applicable to Defence heliport certification.*

(d) *Paragraph 4.2.1 Note 2 does not contain design requirements and is therefore not applicable to Defence heliport certification.*

(e) ***Paragraphs 4.2.4-4.2.7.*** *The appropriate authority to approve aeronautical studies is the DASA.*

(f) ***Paragraph 4.2.5.*** *The circumstances in which shielding may apply are detailed in the ICAO Airport Services Manual (Doc 9137), Part 6, Appendix 3, paragraphs 2.1 through 2.3.*

(g) *Paragraphs 4.2.9 through 29 and Figures 4.7 through 4.12 are not relevant to Defence heliport certification.*

Design element: Visual Aids Provided by Aerodrome Markings, Markers, Signals, Signs, Wind Direction Indicators, and so on.

3.11 *Design requirement. The design of visual aids provided by heliport markings, markers, signals, signs, wind direction indicators and so on must comply with the requirements of ICAO Annex 14, Volume II, Edition 5, Chapter 5 Visual Aids, Section 5.1 Indicators and Section 5.2 Markings and Markers, except for the following:*

(a) *Chapter 5 Note 4, Paragraph 5.2.2.2 Note 3, paragraphs 5.2.2.8, 5.2.3.1, 5.2.4.1, 5.2.8.2, 5.2.9.4 and 5.2.10.2 are not relevant to Defence heliport certification.*

(b) ***Paragraph 5.2.2.7.*** *The second/third sentences are not relevant to Defence heliport certification.*

(c) ***Paragraph 5.2.4.4.*** *The second sentence is not relevant to Defence heliport certification.*

(d) ***Paragraph 5.2.9.7.*** *The second sentence is not relevant to Defence heliport certification.*

(e) *Sections 5.2.11-12 are not relevant to Defence heliport certification.*

(f) ***Paragraph 5.2.13 Note 2****. Taxi-holding position markings applicable to taxiways intended for ground taxiing of helicopters must comply, where applicable, with CASA MOS Part 139, paragraph 8.39.*

Superseded

Design element: Visual aids provided by aerodrome lighting

3.12 ***Design requirement.*** *The design of heliport lighting must comply with the requirements of ICAO Annex 14, Volume II, Edition 5, Chapter 5 Visual Aids, Section 5.3 Lights, except for the following:*

(a) *Paragraph 5.3.1 Note 2 is not relevant to Defence heliport certification.*

(b) *Paragraphs 5.3.9.3, 5.3.9.7, 5.3.9.8, 5.3.9.11, 5.3.9.18 and 5.3.9.20 are not relevant to Defence heliport certification.*

(c) ***Paragraph 5.3.9.15.*** *The chromaticity and luminance of colours must comply with the relevant requirements in MOS Part 139 (Aerodromes) Chapter 9 Visual aids provided by aerodrome lighting.*

(d) ***5.3.12 Taxiway lights.*** *The design of taxiway lights must comply with the requirements for land based aerodromes, detailed in Chapter 2 of this section under the design element – Visual aids provided by aerodrome lighting.*

(e) ***Paragraph 5.3.13.1/2****. The aeronautical studies must be submitted to the DASA for approval.*

(f) ***Night Vision Goggles (NVG) compatible lighting.*** *Heliport lighting of FATOs, helipads, hoverpoints, runways, landing lanes, ground movement areas, helicopter stands and obstacles should be viewable by aircrew using NVG. In particular:*

1. *All lights needing to be NVG-compatible should be provided with variable intensity steps so that the lighting intensities may be customised to match a heliport's ambient light levels. The starting point for designing the intensity steps is described in Section 8.8.1 of UFC 3-535-01 Visual Air Navigation Facilities.*

2. *Lighting of heliport facilities that have the potential to spill light onto movement areas and interfere with NVG operations must not be visible whilst using NVG.*

3. *Obstruction lights should comply with the NVG compatibility requirements in FAA AC 150/5345-43 Specification for Obstruction Lighting Equipment.*

Design element: Communication, Navigation, Surveillance (CNS) and Meteorological (MET) Facilities

3.13 ***Design requirement.*** *The design of CNS/MET facilities must comply with the requirements for land based aerodromes, detailed in Chapter 2 of this section under the design element – Communication, Navigation, Surveillance (CNS) and Meteorological (MET) Facilities.*

Design element: Earthing points

3.14 ***Design requirement.*** *The design of earthing points must comply with the requirements for land based aerodromes, detailed in Chapter 2 of this section under the design element – Earthing Points.*

Design element: Light aircraft tie-down facilities

3.15 ***Design requirement.*** *The design of helicopter tie-down facilities must comply with the requirements for land based aerodromes detailed in Chapter 2 of this section under the design element – Light Aircraft Tie-down Facilities.*

Superseded

Design element: Radio Communication Facilities

3.16 ***Design requirement.*** *The design of radio communication facilities must comply with the requirements for land based aerodromes detailed in Chapter 2 of this section under the design element – Radio Communication Facilities.*

Design element: Aerodromes Rescue and Fire fighting Services

3.17 ***Design requirement.*** *The design of the facilities and equipment used in aerodrome rescue and fire fighting services must comply with the requirements of ICAO Annex 14 Volume II, Edition 5, Section 6.2, except for the following:*

(a) *Paragraphs 6.2.1.1, 6.2.1.2, 6.2.1.3, 6.2.2.4, 6.2.3.2, 6.2.7, 6.2.3.9-14, 6.2.8.1 and Table 6-3 are not relevant to the design of Defence heliports for certification.*

Superseded

DEFENCE SHIPBORNE HELIPORTS

INTRODUCTION

4.1. The ICAO term 'helideck' comprises helicopter landing sites on both ships and floating/fixed off-shore structures. Australian Defence assets only include ships, with no floating/fixed off-shore structures. As such Defence uses the term 'shipborne heliport' to identify 'helideck' as a landing site on ships.

4.2. This chapter details the design requirements for shipborne heliports. These shipborne heliports are used solely for rotary wing operations (including tilt-rotor). For the design requirements for land based heliports, and integrating rotary wing operations into fixed-wing aerodromes, refer to Chapters 1, 2 and 3 of this section.

4.3. Shipborne heliports range from ships with single-spot flight decks, through to large multi-spot ships with extensive movement areas, helicopter runways and multiple combinations of approach paths and operations. The intent of this chapter is to provide design requirements for all types of shipborne heliports, in a form that is scalable depending on the capability requirement.

4.4. The definition of shipborne heliports does not include ship areas used for utility operations (i.e. VERTREP, Transfer). However as these utility operations are often conducted from the area of the shipborne heliport (i.e the flight deck), design requirements for utility operations are specified in so far as they can affect function of the shipborne heliport (e.g. flight deck markings).

4.5. The shipborne heliport design requirements and the associated variations and supplementations defined by the Authority for each of the identified design elements detailed in Chapter 1 Annex A of this section, are described below.

4.6. This Chapter derived all its Safety of Flight (SoF) requirements from DEF(AUST)5000 Vol 11 Pt03 Iss02 (Nov 17). This chapter takes precedence over Vol 11 Part 3 for all SoF requirements. All personnel/ships safety and capability requirements for a shipborne heliport are kept retained in the unaltered DEF(AUST)5000 Vol 11 publications with sponsorship transferred to DGEng-N. DEF(AUST)5000 is the whole of ship Maritime Materiel Requirement Set (MMRS). These requirements will transition into the Australian Naval Classification Framework (ANCF) in due course.

4.7. The DASA should be consulted to resolve any ambiguity, or if further clarification is required in implementing these SoF requirements. Any concerns with requirements coverage, precedence or other issues in relation to SoF shipborne heliport requirements are to be addressed to DASA. Other requirements to DGEng-N.

HAZARD INFORMATION

4.8. Aviation operations at sea are hazardous. They are a 'whole of ship evolution' where the equipment are subject to temperature extremes, high seas and wind states, rotor downwash, high salt-laden environment, black noise levels, radiation from electromagnetic sources along with exposure and close proximity to potentially lethal equipment (weapons, ordnance, rotor blades,

Superseded

exhaust effluxes, high-pressure gas and fluid systems). These operations may be conducted through both day and night, including via NVD and in extreme conditions on wet and moving decks, and within confined spaces. These operations require personnel to be routinely closer to the operating aircraft than may be the case in a shore-based operations.

4.9. It is essential that aviation evolutions are conducted effectively, efficiently and safely to minimise the hazard to the ship, ships personnel and its effect on unrelated ships activities. Aviation operations create extra hazards for the ship, as any accidents endanger the safety of the ship as a whole. An aircraft crash on deck with the related risk of shrapnel damage and an aviation fuel fire could be catastrophic. In times of conflict, the loss of an air asset severely decreases the effectiveness and ability of a ship to carry out its mission to fight and win at sea. Conduct of air operations can affect every department on the ship.

4.10. Shipborne heliport operations experience hazards, additional to those associated with Aerodrome Design elements as defined by DASDRM S6 C1 Annex A. These hazards are associated with the movement of a shipborne heliport (both in location and attitude), communications and situational awareness, which are not covered by an Air Navigation Service Provider as they are for land-based aerodromes. To address these types of hazards, this chapter of DASDRM contains additional requirements for those design elements that are not common to land based aerodromes.

SHIPBORNE HELIPORT DESIGN REQUIREMENTS

Shipborne Heliport Communications

4.11. The various communications networks shall be available at the locations detailed in Table 1.

Table 1 - Communications Networks

STATION/ USER	NETWORK					
	UHF Radio	Main Broadcast[2]	Flight Deck Broadcast	Helicopter Intercom	Flight Deck Team[3]	Phone[5]

Superseded

T – Transmit, R- Receive

Note 1. *Typically the Bridge does not communicate directly with aircraft.*
Note 2. *Main Broadcast is broadcast throughout the ship.*
Note 3. *Flight Deck Team communications should be wireless.*
Note 4. *For FDM communication on the Helicopter Intercom a wireless headset connection shall be provided.*
Note 5. *In this table, ship telephone system includes electronic phone and sound-powered phone for redundancy.*
Note 6. *FDM and FD Crew are unlikely to hear broadcasts with hearing protection donned, however broadcast communications are required when activities are conducted without hearing protection.*

4.12. **External Radio Communications.** The external radio communications detailed in this section shall be provided for all air capable ships to support the coordination of aviation operations at sea. DEF(AUST)5000–Vol 06 Pt 02 Sec 13 provides RAN requirements for radio frequency systems.

4.13. The external radio systems shall be able to communicate with the required aircraft over all ranges required within the Navigation and Tracking aid requirements defined in Table 2 (located at para 4.145).

4.14. **UHF Radio.** A UHF radio patch shall be provided from the ship's normal UHF transmitter/ receiver equipment to the stations indicated at Table 1. A standby UHF radio circuit shall be provided from the ship's normal UHF transmitter/receiver equipment as back-up to the primary UHF system during flying operations. This circuit shall be immediately available in case of failure of the primary circuit for patching to the same stations.

4.15. **Distress Monitoring.** A loudspeaker monitoring facility shall be provided for the International UHF Distress Frequency. This shall be patched through from the ship's normal UHF receiver equipment to the Operations Room, Helicopter Control Station (HCS) and Communications Centre (COMCEN) during flying operations.

4.16. **Emergency Standby VHF Radio.** An emergency standby, battery-powered, portable VHF radio shall be provided on the Bridge during flying operations.

4.17. **Search and Rescue Radio Direction Finding.** All air capable ships shall be equipped with a Radio Direction Finding set capable of giving homing indication from the standard aircrew search and rescue beacon equipment used in the RAN. The normal frequencies used are 121.5 MHz, 123.1 MHz, 243.0 MHz, 282.8 MHz and 406 MHz.

4.18. **Internal Communications.** The aviation facilities communications systems shall be common to the ship's general internal communication systems. Internal communications systems shall comply with DEF(AUST)5000–Vol 06 Pt 06 Sec 01. Facilities shall be provided as specified in the following paragraphs.

4.19. **Intercom System.** An open–line intercom system exclusively for helicopter operations (designated 'HELICOPTER INTERCOM') shall be provided between the stations indicated at Table 1.

(a) The intercom facility shall be combined into the operator's headset.

4.20. **Wire-Free Flight Deck Communications.** A wire-free intercom system (designated 'FLIGHT DECK MARSHALLING') shall be provided. The system shall comply with Australian standards for

Superseded

hearing protection and shall facilitate reception of communications as per Flight Deck Team at Table 1 through individual headsets. Transmit function shall be restricted to the Helicopter Control Officer (HCO), Flight Deck Marshaller (FDM), Landing Safety Officer (LSO) and Flight Deck Officer (FDO) as applicable. The system shall be EMC compatible, intrinsically safe within the operational environment, NVD compliant as required, and comply with Work Health and Safety standards. Consideration should be given for encryption.

4.21.1. **Internal Telephone and Ship's Service Telephone.** Internal Telephone and / or Ship service telephones shall be installed in all aviation-related areas as per Table 1 to provide point to point communications and also conference call facilities. In high noise areas, a flashing light shall be provided to attract attention.

4.21.2 **Sound-Powered Telephones.** A sound-powered telephone system shall be provided as an alternative or as a backup in emergency situations for the Telephone system between the stations shown in Table 1.

4.22. **Broadcast Systems.** The following broadcast systems, applicable to aviation operations, shall comply with DEF(AUST)5000 Vol 6 Pt 6 Sec 1 (except for the reference to ABR 5419 is to be replaced with ANP 3300) and the following:

(a) **Flight Deck Broadcast (FDB).** A broadcast system exclusively for flight deck operations shall be provided as shown in Table 1 with transmit facilities at the HCO, LSO and FDO positions (where applicable).

(b) **Main Broadcast (MB).** Loudspeakers for the ship's main broadcast announcements shall be installed at the positions designated in Table 1 with transmit facilities at the Bridge, Operations Room/Aircraft Control (AC) station, HCO, LSO and FDO positions.

Command Request and Approval Systems

4.23. The ship shall provide a system that enables the HCO/LSO/FDO to request approval for aircraft operations, and then for the Commanding Officer to approve (or not approve) the request without dependence on voice communications.

4.24. **Captain's Ready Deck Circuit.** A Captain's Ready Deck Circuit shall be installed between the Bridge and Operations room and the HCO/LSO/FDO (control position), as applicable, to permit the Captain to maintain control over aircraft operations. The Captain's Ready Deck Circuit shall provide the following facilities:

(a) The HCO/LSO/FDO display/control console shall allow the operator to request clearance/ approval for a particular type of operation (covering all operations the ship is capable of performing). The console shall indicate that the clearance has been requested until the Bridge responds with a YES or NO.

(b) The Bridge display/control console shall include an indicator and cancellable audible device to indicate when the HCO/LSO/FDO has requested clearance for a particular type of evolution. The Bridge shall be able to respond with a YES or NO. An indicator light at the HCO/LSO/FDO shall display the selection made by the bridge indicating if the operation has been approved or not approved.

(c) A display/control console shall be integrated into the Helmsman's control console on the bridge. The display shall be visible to an OOW standing midships of the bridge.

Superseded

(d) A similar display/control console should be located at the Aircraft Controller (AC) position in the Operations room.

(e) The HCO/LSO/FDO, Bridge Staff and AC shall each have the ability to initiate an emergency wave-off. Initiation of an emergency wave-off shall be indicated to all consoles with a combination of flashing lights and an audible alarm. The audible alarm shall be cancellable for each individual station. The emergency wave-off shall be cancelled by the initiating control station only.

Ship External Lighting

Floodlighting

4.25. Floodlighting shall be aimed to provide the best possible illumination of the deck area while keeping spill over of the flight deck to a minimum. Floodlighting shall avoid shining directly into the cockpit during take-off and landing and when on the flight deck.

Night Vision Device Compatibility

4.26. Lighting of ships certified for night operations (Level I or II) shall comply with DEFSTAN 02-587. The NVD compatibility of lighting systems shall be assessed against the class (or classes) of Night Vision system in use on ADF helicopters.

4.27. Lighting includes aviation-specific lights such as deck wash lights, visual landing aids such as SGSI and HRS, and non-aviation lights visible during launch, recovery, VERTREP and transfer operations (examples include emergency lighting, boat deck lighting, etc).

Closed Circuit TeleVision (CCTV) system

4.28. **General.** A CCTV system shall provide a video feed of the flight deck to at least the Bridge, AC station in Operations Room, hangar and HCS for any spots that cannot be seen clearly with the naked eye in the intended range of environmental conditions.

4.29. The CCTV system shall enable appropriate actions in the event of an emergency in addition to general situational awareness as a means of reducing risk.

4.30. The CCTV images shall be fed to Damage Control locations and hangar.

4.31. The CCTV system shall provide a video feed of the hangar to provide images to ship Command and Damage Control locations, so that during an incident, the Crash Rescue Fire Fighting (CRFF) team/s and automated fire detection systems can be monitored.

4.32. **CCTV Video Recording.** The CCTV system shall incorporate a video recording capability with the following features:

(a) All flight deck video cameras shall be recorded concurrently if there is more than one camera.

(b) The video feed to the recorder shall be independent of the selection at any of the displays, i.e. it shall not be possible to inadvertently record a feed other than flight deck cameras.

Superseded

(c) Flight deck video shall be recorded continuously to ensure video recording is not inadvertently forgotten. If this is not the case, then the video recorder control shall be located in the HCS.

(d) The system shall have a minimum seven-day recording capability.

(e) It shall be possible to quarantine video (so that it cannot be deleted) in the event of an accident or incident.

(f) It shall be possible to copy selected video to other media for further analysis or archiving.

(g) The field of view shall provide coverage of the helicopter final approach path and flight deck area during helicopter operations including land/launch, HIFR, VERTREP and Transfer. The camera shall also have remote zoom/scan facility from the HCS, to provide coverage of the landing area, approach paths and hangars

(h) The camera shall have anti-glare and low light capability down to 0.002 Lux.

(i) The camera shall be sited in a position protected from weather and physical damage and fitted with a remotely operated wash/wipe capability.

Fire Protection

4.33. **Aviation Firefighting – Flight Deck.** As described within STANAG 7183, occupants of an aircraft subject to fire can't be expected to survive if exposed for 90 seconds or more. The response and effectiveness of the aviation firefighting system is critical to the rescue of those occupants and wider protection of the vessel and its crew. Therefore, designers shall demonstrate that:

(a) The aviation firefighting system is able to bring the fire under control within one minute (60 seconds) from the incident occurring.

(b) The fire can be contained to enable 'rescue' of the occupants to commence as soon as possible after the incident occurring and suppressed for sufficient time to complete the rescue operation.

(c) The fire can be fully extinguished shortly afterwards.

(d) Sufficient extinguishing agent remains to maintain control of the incident, prevent re-ignition (burn back), protect the vessel and 'cool' any munitions carried by the aircraft. STANAG 4240 details the testing of munitions subject to aviation fuel fires.

4.34. To demonstrate compliance with the above requirements, the designer shall conduct a Fire Safety Study (FSS) in accordance with DEF(AUST)5000, Volume 7, Part 2 Annex B.

Fire Protection – Foam Properties

4.35. Foam extinguishing agent shall meet the requirements of MIL-F-24385F as detailed in DEF(AUST) 5000, Volume 7, Part 2, Annex K.

4.36. The FSS required in paragraph 4.34 shall demonstrate that the foam meets MIL-F- 24385F requirements.

Superseded

4.37. **Foam Quantities and Application Rates.** In determining the foam quantity and application rate to effectively control, contain and extinguish an aviation fuel fire, the dimensions of the largest aircraft that the flight deck is designed to accommodate shall be used to determine the Practical Critical Area (PCA). The method of calculation in STANAG 7183 shall be used to determine PCA.

4.38. For aircraft with external fuel tanks, the width aspect of the PCA does not incorporate the tanks.

4.39. The methodology within DEF(AUST)5000, Volume 7, Part 2, Annex K shall be used to determine the two-dimensional foam quantity requirements in addition to those for the PCA.

4.40. DEF(AUST)5000 Volume 7, Part 2 Annex K shall be used to determine the application rates for foam systems.

4.41. Time from firefighting system activation until correctly proportioned foam is delivered on to the landing area from all Foam Systems shall be documented.

4.42. The FSS required in paragraph 4.34 shall demonstrate how the quantities and application rates were determined for the largest helicopter to be operated, and how they correlate to controlling the fire within one minute, containing the fire, extinguishing the fire and protecting the vessel.

Fire Protection - Remotely Operated Fixed Foam Systems.

4.43. Remotely operated fixed foam firefighting systems shall be installed. In-deck (flush deck) and deck edge sprinklers are the preferred system and shall be designed to meet the requirements in DEF(AUST)5000, Volume 7, Part 2, Annex K.

4.44. Oscillating Foam Monitors are an alternative system, however they shall meet the requirements of DEF(AUST)5000, Volume 7, Part 2, Annex K.

4.45. Fixed foam storage systems, supplying automated fixed foam systems, shall meet the requirements of DEF(AUST)5000 Volume 7, Part 2, Annex K.

4.46. Remotely operated fixed foam systems shall be designed such that the required foam quantity and application rates can still be delivered should part of the system(s) be rendered unusable by the incident occurring. In the case of foam monitors, each monitor shall be able to deliver the required quantity of agent at the appropriate rate should the other(s) become unusable.

4.47. Location of activation points for the remotely operated systems shall be in accordance with DEF(AUST)5000, Volume 7, Part 2, Annex K.

4.48. Remotely operated fixed foam systems shall provide coverage to all areas of the flight deck where the PCA can reside.

4.49. The FSS required in paragraph 4.34 shall demonstrate compliance with the requirements in this section (Fire protection), detailing the system redundancy performance and location of monitors for most effective performance.

Superseded

4.50. Hand-held foam hose lines shall be installed to provide a directed extinguishing agent to the scene of the fire and shall be designed to cover all areas of the flight deck where the PCA can reside.

4.51. Hand-held foam hose lines utilising either fixed proportioning systems or inductors and portable drums of foam shall be provided. The hand-held foam hose lines shall deliver the quantities of foam, at the appropriate application rate, as detailed in DEF(AUST)5000, Volume 7, Part 2, Annex K.

4.52. The location of the foam hose lines shall be designed to afford the best possible protection from damage resulting from the aircraft incident and shall provide full redundancy should other hose lines become unusable.

4.53. Hand-held foam hose lines shall be installed with aspirating foam nozzles.

4.54. Proportioning systems, storage tanks and/or portable drums shall provide sufficient foam agent in accordance with DEF(AUST)5000, Volume 7, Part 2, Annex K requirements.

4.55. The FSS required in paragraph 4.34 shall demonstrate that the design of the foam hand-held hose lines support the remotely operated fixed systems in controlling, containing and extinguishing the fire within the required timeframes, and have the endurance to continue protection of the vessel and 'cooling' of munitions.

Fire Protection – Foam Aspiration

4.56. All flight deck AFFF firefighting systems shall correctly aspirate foam.

4.57. In-deck sprinkling systems naturally aspirate the foam agent at discharge. Non-aspirating in-deck nozzles, meeting requirements of DEF(AUST)5000, Volume 7, Part 2, Annex K, are acceptable.

4.58. Hand-held foam hose lines shall be fitted with aspirating nozzles in accordance with the requirements at DEF(AUST)5000, Volume 7, Part 2, Annex K.

4.59. Foam monitor nozzles shall meet the requirements of DEF(AUST)5000, Volume 7, Part 2, Annex K.

4.60. The FSS required in paragraph 4.34 shall demonstrate that the nozzles for handheld lines, in-deck sprinklers and foam monitors aspirate the foam effectively, having taken into consideration environmental effects, such as the strength of the wind across the flight deck, in conditions reflective of aircraft operations, i.e. Ship Helicopter Operating Limits (SHOL).

Fire Protection - Miscellaneous

4.61. **Operating Instructions.** Operating instructions for all firefighting equipment and systems shall be posted adjacent to the system or equipment.

4.62. To prevent the spread of the fire and reduce effectiveness of the emergency response, fuel (spillage) from the flight deck shall not be able to enter the hangar.

Superseded

4.63. **VERTREP Operating Area.** The fixed fire-fighting system (remotely operated and hand held) requirements for air capable ships shall be met for operations to VERTREP operating areas. The FSS required in paragraph 4.34 shall demonstrate how the design of the system(s) reflects the largest aircraft that shall conduct the operation (including largest fuel load), taking into consideration the types of underslung load for the type of vessel.

Aviation System Storage Area

Hangar Doors

4.64. **Hangar Door Pressure Tolerance.** The hangar door shall be operable (open and close) with winds in any direction up to 60 kts.

4.65. **Hangar Door – Requirements when Closed.** In the closed position, the hangar door shall:

(a) Prevent any light from being visible from outboard during 'Darken Ship' conditions.

(b) Comply with fuel-spill prevention requirements of paragraph 4.62.

4.66. **Other Hangar Accesses.** In addition to the main hangar door access, there shall be a general access between the flight deck and hangar area. This access shall be provided for normal passage, and may be used for emergency passage as per the requirements of paragraph 4.85 and 4.86. The general access shall be operable from both sides, open onto the flight deck and, when closed, maintain the weather tightness and fire resistance of the hangar area. Provision shall be made at this hatch for blackout curtaining to prevent light from the hangar being shown inadvertently on the flight deck. Access to the interior of the ship from the hangar shall also be available. General access from the flight deck to the interior of the ship shall not be via the hangar/hangars.

4.67. **Viewing Port.** The hangar general access door, or the immediate surround, shall be fitted with a viewing port, which permits CRFF team in the hangar to observe operations on the flight deck when the hangar door is closed. The viewing port shall:

(a) Meet the requirements of paragraph 4.181.

(b) Be fitted with an integral blackout cover that shall prevent light from spilling onto the flight deck, remain attached when open and closed, and shall be able to be locked in both the open and closed position.

Hangar Internal Lighting

4.68. Hangar internal lighting shall be controlled such that it will automatically switch to night lighting if the hangar door (or other hangar access to the flight deck) is opened while the lights are on.

Flight Operations Area

Clearance Criteria for Landing and Launching Operations

4.69. For a ship to be certified to land and launch a helicopter, certain minimum clearances within defined clearance areas and approach flight paths are required and shall be assessed separately for each helicopter type under consideration.

Superseded

4.70. The clearance criteria are based on a concept of a landing scatter (dispersion) and an airborne scatter (see Annex A). The landing and airborne scatter are centred on a nominal landing position, or 'reference position'. In essence, several clearance 'volumes' are constructed and overlaid on the flight deck, and any part of the ship superstructure or components on the flight deck shall lie outside of these volumes.

4.71. **Reference Position.** The reference position (also called the landing position) is the intersection of the fore/aft position line, known as the Pilots Eye Line (PEL) and the lateral line-up line painted on the flight deck. The pilot's eye line shall pass through the fore/aft position line, and the aircraft shall be centred on the lateral line-up line.

4.72. Minimum helicopter clearances are given in Annex A to this chapter.

Flight Deck

4.73. The flight deck is the clear area of deck where air capable ships conduct helicopter operations including landing, take-off, parking and traversing. The flight deck area includes the total deck area outside of the helicopter landing area.

4.74. Ships exhaust can have a significant negative impact on helicopter performance. Siting of the flight deck shall consider location in reference to ships exhaust systems.

Flight Deck Marking

4.75. The flight deck and landing area shall be marked to provide the aircrew with reference lines and guidance for the touchdown area and/or VERTREP/Transfer/HIFR point. Landing area markings and clearances shall be provided for Class 1, 2, 2A or 3 operations. The marking arrangements for a landing area are dependent on the aircraft type to be operated and the approach path and landing orientation of the helicopter. Generic deck markings are shown at Figure 2.

4.76. For new ships or resurfaced flight decks, the following requirements shall be met:

(a) **Fore/aft Position Line.** The fore/aft position line shall pass laterally through the Pilots Eye Line when the aircraft is in the optimal landing position on the flight deck, and extend athwartships across the entire flight deck to provide maximum visibility. On narrow ships (e.g. frigates and destroyers), the fore/aft position lines shall be extended to the extremity of the flight deck nets and should extended beyond the flight deck nets.

(b) **Lateral Line-up Line.** The lateral line-up line shall pass through the centre of the landing position and forward as far as practicable, including vertically up the bulkhead forward of the flight deck (or hangar door if the hangar is located forward of the flight deck). The lateral line-up line should also continue aft to the aft periphery line marking. The lateral line-up line may also extend vertically down the stern of the ship if practicable.

(c) **NVG Lines.** Dashed NVG lines shall be painted forward from the landing position at an angle of 35-40° from the centreline. The NVG lines shall be positioned such that the starboard NVG line emanates from the right seat pilot position (whilst the primary aircraft is positioned in the optimal landing position), and the port NVG line emanates from the left seat pilot position, as shown at Figure 1.

Superseded

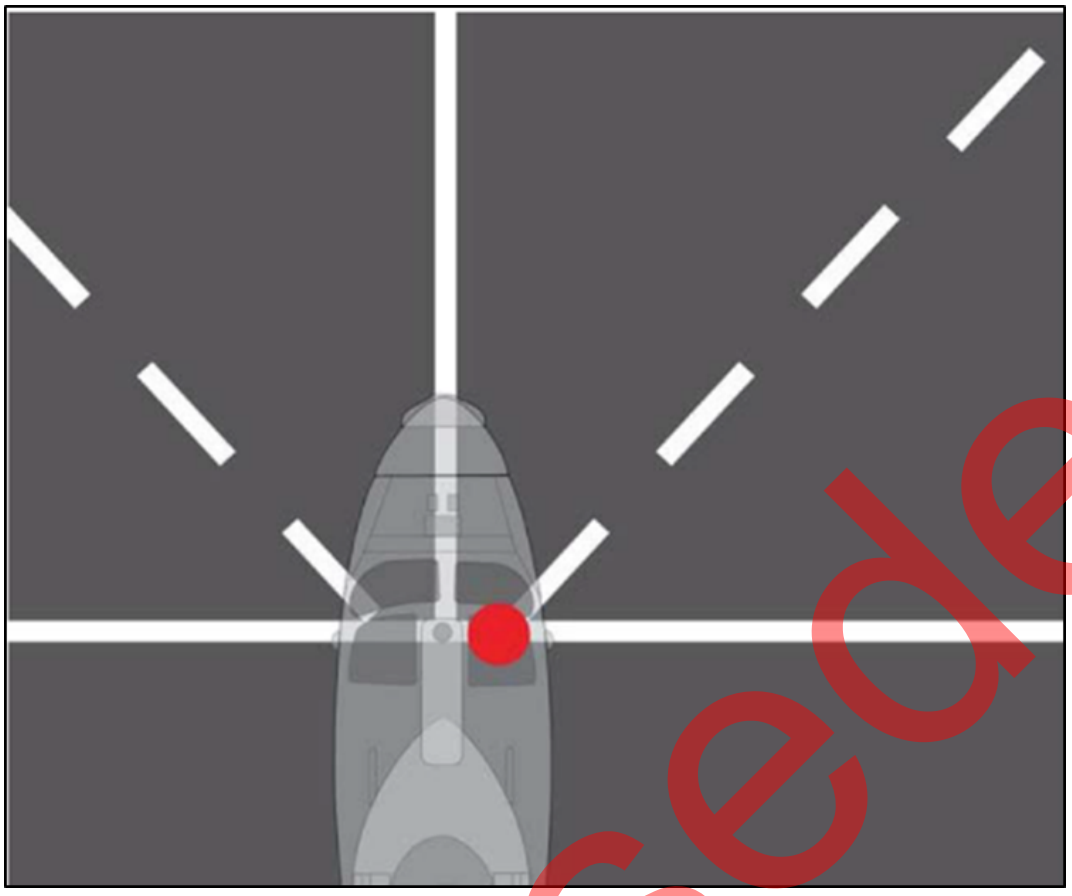

Figure 1 - NVG Line-up Lines

(d) **Periphery Lines.** Periphery lines shall be marked near the deck edge so that the pilot can avoid the edge or obstructions during landing, and to assist flight deck team situational awareness, particularly at night.

(e) **Rotor Clearance Line.** A red rotor clearance (safety) line shall be painted on the flight deck to identify the region where the main rotor could sweep, taking into account airborne scatter. The placement of this line shall be conducted considering room for the deck team to stand during manned flight deck launches and recoveries. See Annex A paragraph 4.A.12.

(f) **Deck covering.** The entire deck area (within the periphery line markings and all aircraft traversing, hangar and parking areas) shall be covered with dark grey non-slip deck covering compound and shall meet the required friction standard (see paras 4.79 and 4.80).

(g) **Marking lines.** Unless otherwise stated, marking lines shall be 300 mm wide and painted with white non-slip paint. The paint shall also meet the required friction standard (see paras 4.79 and 4.80).

(h) **HIFR marking.** If the vessel is capable of conducting HIFR operations, a white 'H' shall be painted in accordance with Clearance requirements at Annex A and Figure 3 to indicate the appropriate area.

(i) **VERTREP markings.** If the flight deck is to be used for VERTREP operations, then the VERTREP markings shall be provided in accordance with MPP-02.3.3 Vertical Replenishment (VERTREP) Operating Areas, Marking, Clearances and Lighting.

Superseded

(j) **Hull number.** The ship's hull number, conforming to the standard prescribed in Figure 4, shall also be painted within the periphery line markings to aid in identifying the particular vessel.

(k) **Armament Installation/RADHAZ Danger Areas.** Armament installation hazard area (e.g. Weapon arc movement line)/RADHAZ danger areas shall not impinge within the periphery line markings of a flight deck area.

Flight Deck Physical Characteristics

Common Deck Markings for Aviation Operations

4.77. **Typical Flight Deck Configuration.** Figure 2 shows generic flight deck markings for an air capable ship.

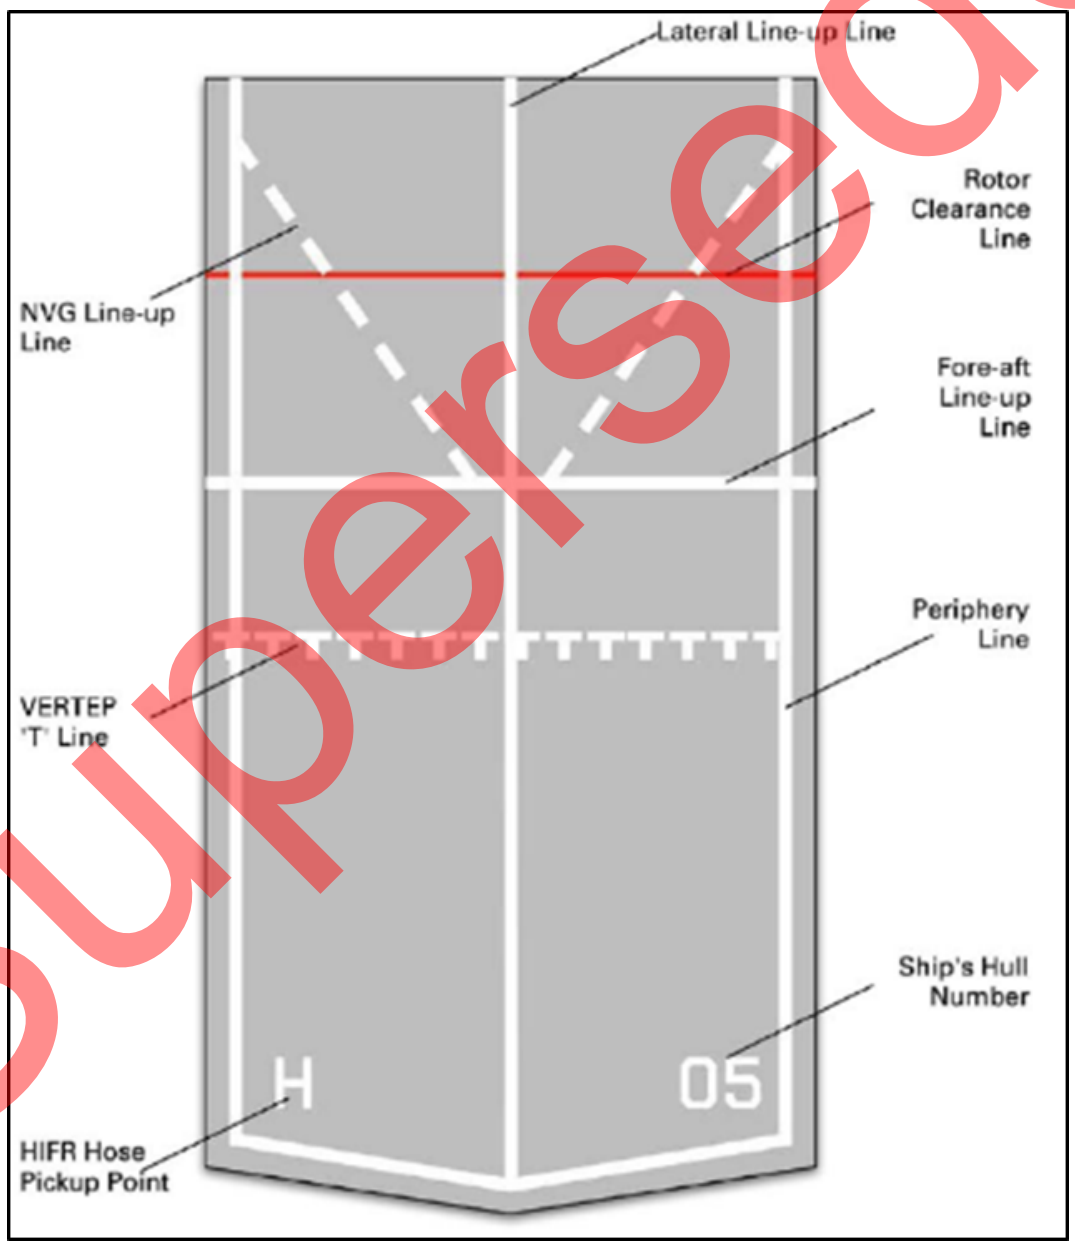

Figure 2 - Common Flight Deck Markings

Superseded

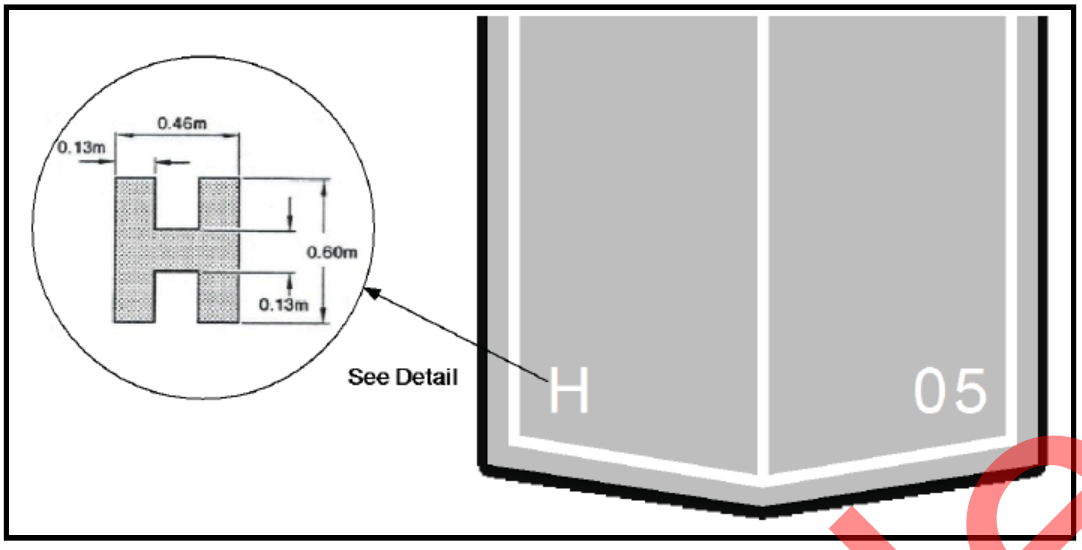

Figure 3 - Typical HIFR Point Markings and Dimensions (Refer to Annex A for 'H' location requirements)

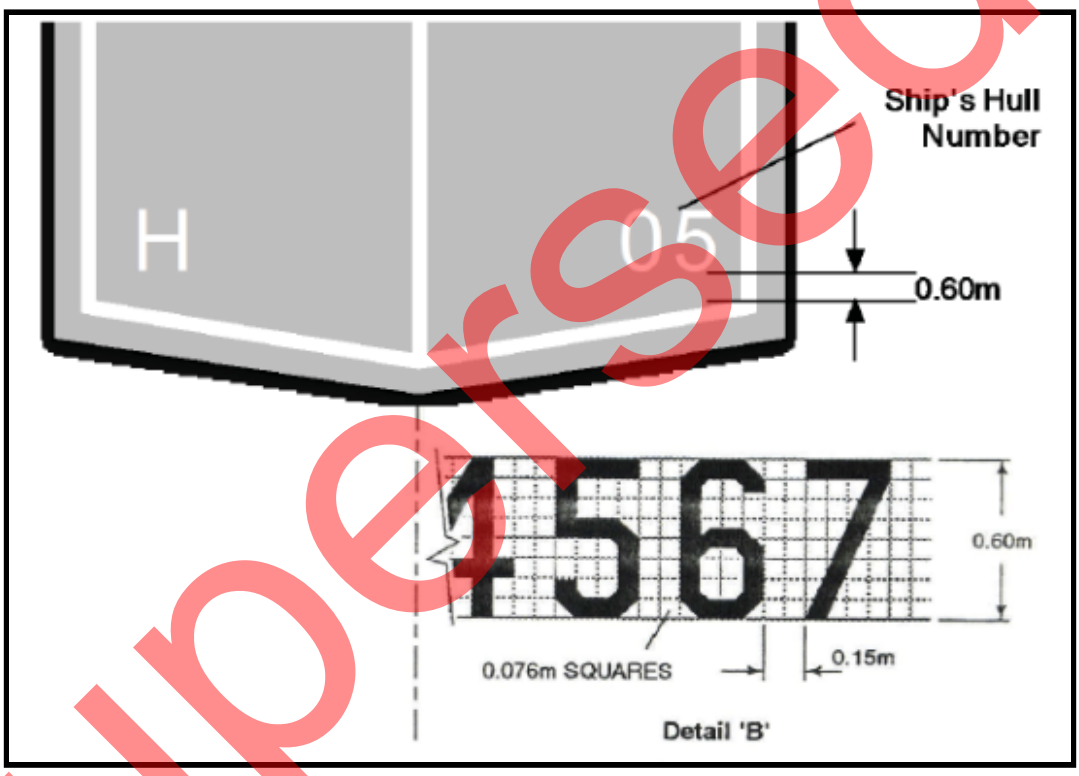

Figure 4 - Typical Marking of Hull Numbers (Detail B is applicable to ships with single spot operating areas e.g. DDG & FFH)

4.78. **Deck Strength Criteria.** The flight and hangar deck structure shall withstand all loads with aviation operations including landing, parking, traversing and crash loads imposed as a result of the aviation operations for which the vessel is to be certified. This includes elevators, hatches, covers etc when they are part of the aircraft landing, parking, hangar or traversing areas. There shall be no evidence of excessive deformation, deterioration or corrosion, and the welding shall be smooth and even. The design standard to be adopted shall be in accordance with DEF(AUST)5000 Volume 3, Part 1 Hull System Requirements, Surface Ship Structure for all aircraft types for which the ship is to be certified to operate.

Superseded

Surface Friction Requirements

4.79. Deck friction for new deck coatings shall meet a coefficient of friction of 0.8, and shall comply with the requirements of STANAG 1278.

4.80. Although STANAG 1278 is applicable to measurements on dry flight deck, RAN vessels shall also comply with this requirement for wet flight decks.

4.81. Specifications for paint are detailed at DEF(AUST) 5000 Volume 3, Part 4.

4.82. The flight decks shall be tested for friction factor after initial application of the deck coating

Flight Deck Safety Nets

4.83. **Obstructions.** Flight deck nets shall be hinged in such a manner that a level or positive angle above the horizontal is achieved with no part of the nets being more than 110 mm above flight deck level when in the lowered position.

4.84. The nets shall be lockable in the lowered positions.

Aircraft Operating Area Access/Egress

4.85. Aircraft operating areas (flight decks, VERTREP and transfer areas) shall have a minimum of two access/egress routes so that in the event of an accident or incident, personnel will be able to escape upwind of the landing area. Access routes shall also facilitate access by CRFF teams.

4.86. Adequacy of the flight deck emergency response and escape arrangements shall be included in any evacuation, escape and rescue analysis.

Helicopter Securing Fittings (Tie-Down Fittings)

4.87. The flight deck area shall provide the means to safely secure aircraft to the deck.

4.88. **Strength.** The strength of ship tie-down fittings shall be designed so that the structure shall not yield before the lashing breaking load is reached, including the case where up to two lashings are applied simultaneously. Standard lashings are assumed to be TD1A/B lashings, each with a nominal safe working load (SWL) of 10 000 lbf, and minimal proof load of 1.5x SWL in accordance with ANP4412-4314-1, Chapter 7. NAVSEA Drawing 803-1916300 is an acceptable standard.

4.89. **Integrity Testing.** Tie-down fittings shall be installed and tested in accordance with the design standard used or a qualified Weld Procedure Specification.

4.90. **Mounting**. The tie-down fittings shall be recessed to comply with the obstruction limitations detailed at Annex A.

4.91. **Compatibility.** All fittings shall be compatible with the tie-down assembly and lashing in use in the RAN.

4.92. **Location.** Tie-down fittings shall be installed throughout the aircraft landing area.

Superseded

4.93. **Spacing.** Spacing shall be between alternate intersections of a 1.1 m grid. Fittings on other grid patterns or variations due to interferences should be acceptable provided their arrangement allows for maintenance of effective lashing patterns for all aircraft to be operated.

Flight Deck Equipment

4.94. **Mooring Aids.** Mooring aids (tie-downs) for aircraft securing shall meet the requirements of the aircraft certified for aviation operations and the approved lashing scheme analysis for the ship's tie-down point pattern (see paragraph 4.92). Indicative numbers of tie-downs required per aircraft shall be found in the aircraft chapters of ANP 3300. Mooring aids quantities shall be included in the ship's Outfit Allowance List (OAL). Numbers of tie-downs held on-board shall consider operating the flight deck with other aircraft while all organic aircraft are stowed.

4.95. **Flammable Liquids.** No flammable liquid (gasoline, oil etc) cans, drums or tanks are permitted within 7.6 m of the flight deck periphery line markings.

VERTREP and Transfer Operations

4.96. **VERTREP and Transfer Operations in an Air Capable Ship.** VERTREP and transfer operations in an air capable ship are normally carried out to the flight deck, and the same facilities are used as for normal flight operations. For the VERTREP facilities, co-located with the Flight deck – requirements for VERTREP in this DASDRM chapter apply.

4.97. Some ships may have a VERTREP and/or transfer area remote from the flight deck. DASA has determined that independent assurance for dedicated VERTREP or Transfer-only facilities do not warrant DASA's independent assurance. However as many requirements share a number of commonalities and relationship with requirements within the scope of DASA's assurance. This chapter of DASDRM will maintain benchmark requirements for the design of such facilities, even if they are not subject to the Authority certification.

4.98. For VERTREP or Transfer-only area design requirements regarding markings, clearance and lighting from MPP-02.3.3 Vertical Replenishment (VERTREP) Operating Areas, Marking, Clearances, and Lighting, are to be used as the benchmark.

4.99. Additional to the requirements for markings clearance and lighting. Depending on the scope of intended vertrep operations, other requirements from this chapter (e.g. navigation, communication and control) may also be used as a benchmark for the design.

Landing aids

Lighting and Visual Approach Equipment

4.100. A basic standard of lighting shall support the safe conduct of aviation operations at night (i.e. Level I and II) in all air capable ships.

Superseded

General Lighting Adjustment and Balance

4.101. Aviation lighting used to orient the pilot and assist in conducting accurate operations about the ship (e.g. deck wash lighting, strip lighting, floodlighting etc.) shall be adjustable (ie have a dimming function) to account for variations in ambient lighting, visibility and pilot preference.

4.102. Each light system shall be individually adjustable for the purpose of achieving a harmonious balance amongst all aviation lights during night and NVD operations.

4.103. Lighting designed for long-distance viewing (3-5 nm) shall be designed such that it is not too bright when viewed in closer proximity, and shall not require manual adjustment to achieve this balance.

4.104. **Long Range.** The overall lighting configuration of the ship (including obstruction lights, navigation lights and specific aviation lights) shall be designed so that a typical pilot can coarsely ascertain the ship's orientation from approximately 3-5 nm.

4.105. **Medium Range.** From approximately 0.5 nm, the lighting shall aid the pilot in ascertaining the ship's orientation and enable identification of major features such as the flight deck and forward superstructure, as well as identifying major flight deck markings such as the lateral line-up line and fore/aft position line.

4.106. **Close In.** While in the flight deck environs, the pilot shall clearly be able to identify the deck edge, lateral line-up line, including vertical lateral line-up line/s and fore/aft position line, as well as seeing hangar features and finer textural detail on the flight deck such as tie-down points. If the pilot is using Night Vision Devices (NVDs), then the NVD lines shall also be clearly visible.

Homing Beacon

4.107. A white homing beacon shall be located as high as practicable on the mast/superstructure. It shall be visible for at least 330 degrees in azimuth and produce approximately 90 flashes per minute. The beacon shall be capable of being dimmed but the flash rate is to remain constant regardless of the light intensity. The minimum visible range on a clear night shall be 6 nm.

Horizon Reference System

4.108. For ships with an aft flight deck, a Horizon Reference System (HRS) shall be installed to provide a representation of the position of the horizon to assist the pilot to recover to the deck at night. The HRS shall be stabilised for roll angles of at least 15°.

4.109. The HRS shall be installed just forward of the flight deck so that it is approximately level with the pilot’s eye line when the aircraft is hovering over the deck.

Glide Slope Indicator

4.110. A gyroscopically stabilised glide slope indicator (SGSI) shall be installed on the extended axis of the preferred approach. The SGSI shall conform to the requirements of STANAG 1236. The SGSI shall be a Type NVD-YGR (detailed in STANAG 1236(4)). The centre of the green band (glide slop) shall be 3° above the horizontal with the projection pattern illustrated at Figure 5.

Superseded

4.111. When more than one night approach path to the flight deck is required, the SGSI shall be trainable to align with all approach paths.

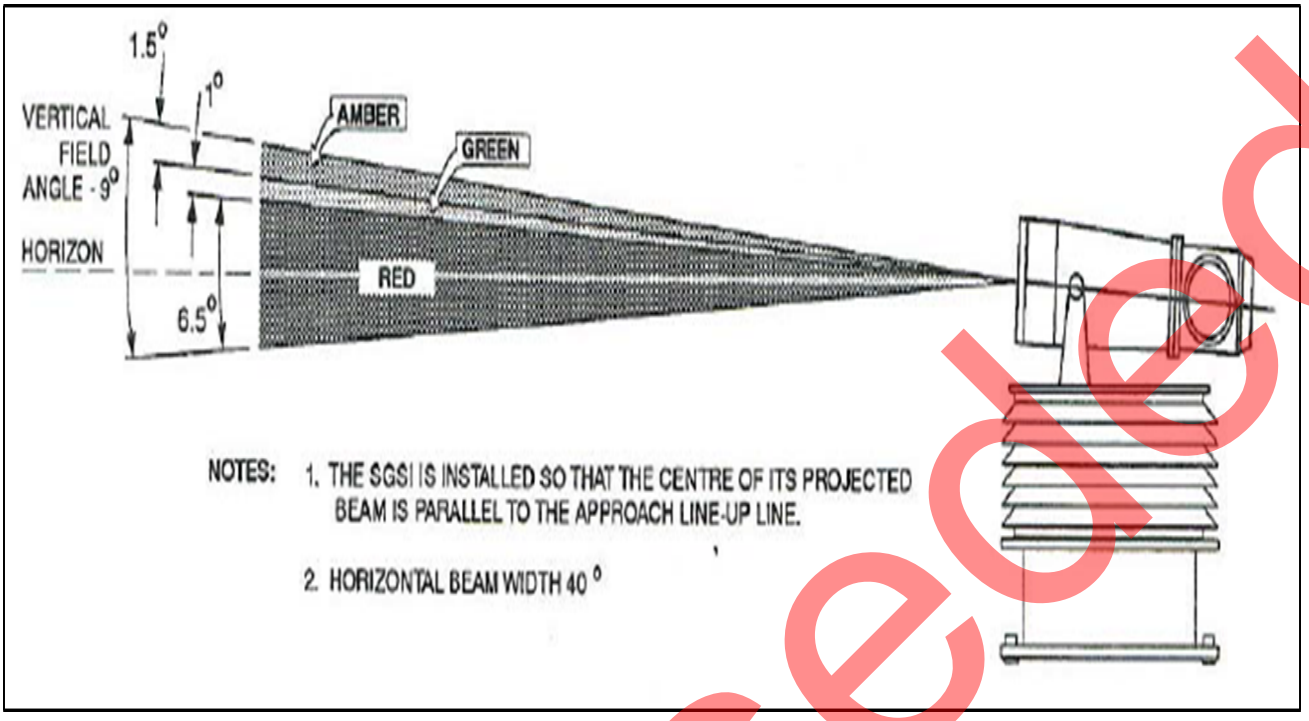

Figure 5 - Stabilised Glide Slope Indicator

Obstruction Lights

4.112. A minimum of two blue lights shall be installed to mark both the top and outboard limits of shipboard structures closest to the operating area. The lights shall be controlled by a single ON/OFF switch. Dimming shall not extinguish the lights.

Level III Operations – All Ships

4.113. For Level III (three) daylight operations, a deck status light system and emergency wave-off light system shall be installed. Where the aircraft is expected to be maintained overnight, maintenance floodlighting (fixed or portable), shall be available.

Deck Status Light System

4.114. The deck status lighting system shall convey the status of the flight deck through a combination of lights, symbols and/or flashing in accordance with one of the systems detailed in STANAG 1472; however, the system described in Annex B of STANAG 1472 is preferred by the RAN (Steady Three Colour Light With Symbology Status Display)

4.115. The status indication shall be clearly visible in direct sunlight, but also dimmable for night and NVD operations, however the dimming shall not extinguish the lights.

4.116. The NVD compatibility and intensities detailed in STANAG 1472 shall be complied with.

Superseded

4.117. Controls shall be provided at the HCO/LSO/FDO to enable the operator to select the deck status system to red, amber or green. Selection of red, amber or green shall be mutually exclusive.

4.118. A deck status repeater shall be included on the Bridge and AC display/control consoles. This repeater represents the deck status as selected by the HCO/LSO/FDO.

Emergency Wave-Off Light System

4.119. A wave-off function shall be implemented to provide an indication to the pilot to abort the approach. The wave-off indication shall be clearly visible in direct sunlight, but also dimmable for night operations, however the dimming shall not extinguish the lights. Ranges shall be applicable for the hazards that wave-off shall be initiated to control (for example greatest RADHAZ range).

4.120. For commonality with existing RAN systems, the wave-off lighting should be implemented by two red wave-off lights located adjacent to and on either side of the SGSI, in conjunction with flashing of the red deck status light.

4.121. Alternatively, wave-off functionality could be achieved by alternative lighting systems (such as a flashing Pilot Information Display (PID) and/or flashing red deck wash / strip lights) provided that the indication is unambiguous and visible by day and night. Flashing rates required for NVD compatibility shall not coincide with flashing rates of either the SGSI or PID.

Ship Motion Parameters

4.122. Ship motion displays for aviation operations shall display ship's pitch and roll attitude as a minimum.

4.123. Dynamic pitch and roll should also be displayed by subtracting trim from absolute pitch and subtracting list/heel from absolute roll. Trim is calculated by averaging pitch over a configurable time period. Similarly, list/heel is calculated by averaging roll over a configurable time period.

4.124. **Ship Motion Measurement.** Pitch and roll indicators shall be accurate to ±0.25°, with a display resolution of 0.1°, and angular range of ±45°.

4.125. **Ship Motion Limits Monitoring.** Ship motion displays shall include a capability to set desired pitch and roll limits. When the pitch and roll limits are exceeded, the display shall provide a visual indication to the operator that the limits have been exceeded and what the maximum pitch and roll was. If dynamic motion limits are employed, then it shall be possible to set dynamic limits and display exceedance of the limits.

4.126. The ship motion display shall display historical motion and limit exceedance for a configurable time period between one minute and 10 minutes. The system may provide the ability to record ship motion for 24 hours.

Wind Speed and Direction System Displays

4.127. Relative wind displays shall display the average wind speed and direction over a 10- second moving average.

Superseded

4.128. Relative wind displays should display the instantaneous relative wind speed and direction based on a one-second average. Such a display shall also include a history of the previous 10 seconds of instantaneous wind.

4.129. The display of relative wind shall include a numeric display of the 10-second moving average as well as a relative wind plot showing the average and instantaneous relative wind.

4.130. The relative wind display should provide the time-averaging period.

4.131. The relative wind display shall provide a clear indication of which anemometer (or algorithm) is used as the data source.

4.132. The relative wind display should overlay the wind speed and direction display with the approved relative wind envelope to improve the ease of determining whether the relative wind is within limits prescribed in the SHOL. This can assist operators in determining ships course and speeds that will place relative winds within SHOL.

Anemometers

4.133. **Anemometer Accuracy.** Anemometer sensors used in the Wind Speed and Direction System (WSDS) shall have a speed accuracy better than 3% and a directional accuracy of ±5°. The operating range shall be as per DEFAUST(5000) Vol 10, Part 2, paragraph 5.4.4.1, i.e. from 0.5 to 60 m/s.

Anemometer Placement

4.134. Anemometers shall be positioned in clear air above the ship's superstructure and outside the influence of the ship's air-wake.

4.135. If the location does not provide an unobstructed airflow throughout all azimuths (i.e. 360°), then two or more anemometers shall be mounted. Larger ships may require additional anemometers further aft to detect winds abaft the beam.

4.136. Anemometers sited on masts shall be in free air, in a location uncluttered by adjacent equipment with at least 3.0m radius free air space around each anemometer.

4.137. Anemometers shall be positioned so that they are not subject to electromagnetic interference from ship's emitters.

Course and Speed

4.138. Ship's course and speed displays shall be available at specified stations as per Table 4 (located at para 4.154). The operator should be able to select between either speed through the water (log speed) and heading from the ship's gyro, or GPS speed and track.

4.139. The course, speed and position navigational accuracy requirements shall be in accordance with DEF(AUST) 5000 Volume 10 Part 2.

Superseded

QNH

4.140. A reading of QNH (atmospheric pressure—Q at Nautical Height) in Hectopascals shall be available at specified stations as per Table 4. QNH may be sourced from a calibrated ship-based barometer as per DEF(AUST)5000 Volume 10 Part 2 (which, in turn, refers to WMO Publication 08), or from an airfield weather station report that is valid for the time and location of the ship.

Outside Air Temperature

4.141. A reading of Outside Air Temperature (OAT) in degrees Celsius shall be available from the ship-based weather station as per DEF(AUST)5000 Volume 10 Part 2 (which, in turn, refers to WMO Publication 08).

Signalling Aids

4.142. Signalling aids shall be stowed adjacent to the FDO/FDM position:

(a) **Day Signalling.** The FDO/FDM shall use hands or marshalling bats to conduct day signalling.

(b) **Night Signalling.** The FDO/FDM shall use two battery-powered wands to conduct night signalling with a spare wand available. The wands shall be NVG friendly in accordance with DEFSTAN 02-587, and all three wands shall be the same colour.

Navigation and Tracking Aids for Level I and Level II Certification

4.143. In general terms, the aids for Level I aviation operations shall satisfy the following three requirements:

(a) Assist aircraft navigating to the ship from a long range.

(b) Allow aircraft to make an instrument approach to the ship.

(c) Allow the ship's command team to maintain situational awareness of air assets in the vicinity of the ship.

4.144. The required navigation and tracking equipment function and performance characteristics as detailed in Table 2 shall be provided to support Level I or Level II aviation operations as part of a Shipborne Heliport Certification. A ship system may comprise of combined sensors/systems to provide the detection and recovery requirements as specified. Systems shall be proven to work in envisaged operating conditions (including varying levels of precipitation and sea state) based on the vessels envisaged scope of operations.

4.145. For Level I certification, flight testing shall be conducted with representative aircraft types and number of aircraft to confirm that the system can achieve the requisite performance and functionality.

Table 2 - Navigation Equipment for Level I and II Operations

	NAVIGATION	SEPARATION	INSTRUMENT APPROACH

Superseded

Level I	**Mandatory** Ship radar system to detect aircraft from at least 20 nm and 1000 ft and 10 nm at 400 ft from all azimuths. Maintain consistent contact with aircraft as aircraft nears the instrument approach gate (2 nm, 400 ft). Plus, **at least one** of the following: • Aircraft UHF homing • Direction Finding • Aircraft radar • Aircraft Tactical Data System • Ship Homing beacon • Aircraft TACAN receiver and ship TACAN transmitter • Local positioning system • Aircraft FLIR • Aircraft NVD • Aircraft GPS It is **desirable** to have these items fitted	**Mandatory** Ship radar system must be able to maintain track of helicopters within the SCZ. Typically 0.5-2 nm at 200-400 ft, and 0.25-0.5 nm 100-200 ft System must have the ability to maintain multiple tracks in the SCZ (the number to be defined by the envisaged scope of operations) System should be able to display individual contacts as designated by the operator. **Desirable** • Aircraft radar • Aircraft Tactical Data System • Aircraft NVD • All aircraft fitted with air-to-air TACAN	**Mandatory** Radar tracking to be maintained from the gate (2 nm, 400 ft), top of decent (1.2 nm, 400 ft), through decent to the missed approach point (0.2 nm, 125 ft). Coverage to ±20° of approach path, as well as steep or shallow approaches. Maintain tracking through missed approach (possible less than 125 ft) to 400 ft. Maintain tracking during ELVA approach. Plus, **at least one** of the following: • Aircraft radar • Second radar, with performance as described above • Aircraft TACAN receiver and ship TACAN transmitter • Local positioning system (provided there is an instrument approach that has been approved with such a system)
Level II	**Mandatory** • Radar as described above OR • Aircraft UHF Homing	**Desirable** • Radar as described above • Aircraft radar • Aircraft Tactical Data System	**Desirable (night visual approach may be conducted)** • Radar as described above • Aircraft radar • Aircraft TACAN receiver and ship TACAN transmitter

Superseded

	OR • Aircraft GPS **Desirable** • Aircraft Radar or LF/VHF/ UHF homing (if not in mandatory equipment) • Aircraft Tactical Data System • Local positioning system • Ship Homing beacon • Aircraft TACAN receiver and ship TACAN transmitter • Aircraft FLIR • Aircraft NVD	• Aircraft NVD • All aircraft fitted with air-to-air TACAN	• Local positioning system

4.146. **Identification Friend or Foe (IFF)**. A ship certified to Level I aviation operations shall have an identification friend or foe (IFF) interrogator capable of interrogating in Modes 1, 2, 3, C 4 and 5 (Level II) certified to either US AIMS 1000B Standards suite or NATO STANAG 4193. The helicopter control display shall be capable of displaying all modes and emergency IFF codes. Trials and periodic tests of the equipment shall be conducted in accordance with ANP 3412-4202.

Recovery Assist, and Securing System

4.147. Where an operational requirement exists, a system shall be provided that assists in the recovery of the aircraft and/or secures the aircraft to the flight deck upon recovery or prior to launch.

4.148. Wire recovery systems shall comply with requirements of MPP 02(H) Annex A013. Harpoon systems shall comply with the requirements of MPP02(H) Annex A014 and STANAG 1276.

Superseded

4.149. For ships requiring Level I (one) and II (two), Class 6 (HIFR) certification, three heading lights shall be installed in accordance with Figure 6. The HIFR heading lights shall be controlled by a single dimmer control and on/off switch. The maximum distance between the HIFR 'H' and the aft-most HIFR heading light shall be 75 m ('E', as specified on Figure 6).

4.150. HIFR heading lights shall be installed as far to port as feasible. All three lights shall be the same distance from the ship's centreline and shall be simultaneously visible to the pilot during the refuelling phase of the HIFR operation. The pilot is positioned opposite the hose pick-up spot at approximately 9 m to the port side of the ship at a height of 18 m. All three HIFR heading lights shall be the same distance above the ship's base line. All HIFR heading lights shall be installed between 6 m to 7 m above the HIFR deck.

4.151. If HIFR heading light(s) extend into the firing sector of the ship's guns and/or missiles, the light(s) shall be installed on a portable support.

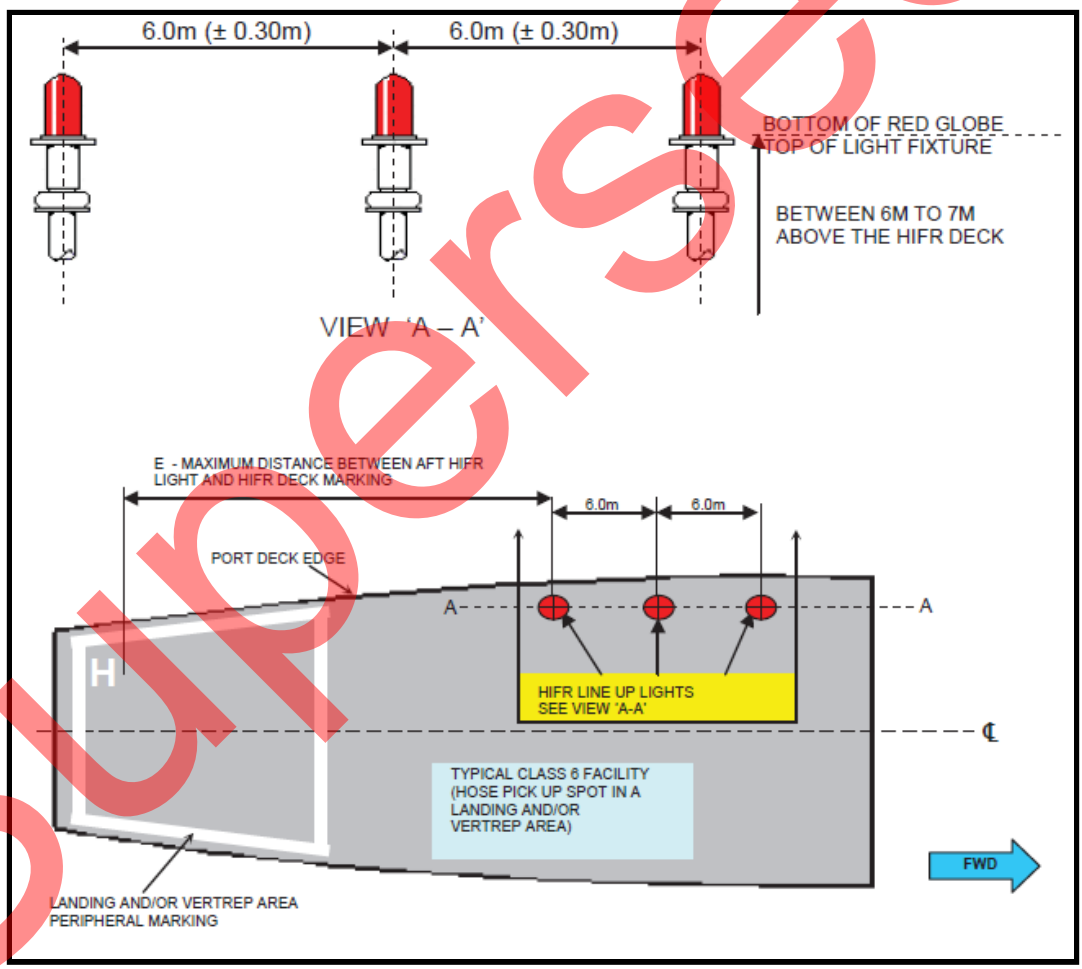

Figure 6 - Typical Arrangement of Visual Aids for HIFR Areas

Superseded

4.152. **Fuelling System Requirements for HIFR.** The helicopter in-flight refuelling (HIFR) fuel system shall provide a minimum flow rate of 230 l/min at a height of 65 ft above sea level, providing 50 psi at the refuelling nozzle. A lesser flow rate and pressure, as per STANAG 3847, may be acceptable provided that the system can refuel an aircraft in a timeframe that is operationally acceptable.

Aviation Station Configuration

4.153. Aviation stations shall be provided to support the ship's staff involved in control of the aviation evolution as defined in ANP 3300 (principally HCO, AC, LSO, FDO, FDM, and HD). Table 3 shall be used to determine the aviation station configuration that is appropriate to the intended Level and Class of operation.

Table 3 - Aviation Station Configurations

	Level I				Level II				Level III			
	Class				Class				Class			
Aviation Station Configuration	**1,2,3**	**4,5**	**6**	**7**	**1,2,3**	**4,5**	**6**	**7**	**1,2,3**	**4,5**	**6**	**7**
Bridge, AC, HCO, LSO (RAST Operations)	X	X	X	X	X	X	X	X	X	X	X	X
Bridge, AC, HCO (No RAST, but maybe ASIST)	X	X	X	X	X	X	X	X	X	X	X	X
Bridge, HCO					X	X	X	X	X	X	X	X
Bridge, FDO					p	p	p	p	X	X	X	X
VERTREP Only Control Station						f				X		
Transfer Only Control Station								X				X

Notes

p – it is possible to conduct Level II operations with just a Bridge and FDO, but this is not

Superseded

recommended

f – night VERTREP is presently only conducted in specific circumstances by RAN

Aviation Station Equipment

4.154. Table 4 stipulates the minimum required equipment at each of the aviation stations for helicopter operations.

Table 4 - Aviation Station Equipment

Equipment	Helicopter Control Station (HCO/LSO/FDO)	Bridge	Aircraft Controller Station	VERTREP/ Transfer Control Station
Ship Motion Display	Required	Required	Required	Required
Relative wind speed and direction	Required	Required	Required	Required
Course and speed displays	Required	Required	Required	Desirable
QNH and OAT available	Required		Required	
Lighting controls for flight deck and the associated aviation lights, such as the homing beacon and HIFR line-up lights (including lighting intensity controls)	Required			
Controls for deck-status display	Required			
Deck-status display status so that the OOW/OPSO maintains situational awareness of aspects that may impact on the safety of the ship.		Required	Required	
Controls (and display) for the emergency wave-off.	Required	Required	Required	
If the ship does not have a dedicated emergency wave off switch, then the equivalent functionality shall be provided by having override control of Deck Status indication to		Required	Required

Control Station Field of View

4.155. **Helicopter Control Station (HCS) Field of View.** The HCS shall be located so that the operator can view both the aircraft and the aircraft operating area without moving away from the controls. The view from the position shall be unobstructed and include all flight deck areas normally occupied by personnel during flight operations and all of the aircraft during approach, hover, landing and take-off.

4.156. **Landing Safety Officer Station Field of View.** In addition to accommodating RAST/ASIST controls, the Landing Safety Officer (LSO) control station shall be located so that the RSD/helicopter main probe interface, hook-up team and traversing crew can be viewed from the LSO station. The use of a CCTV camera system to display live video of the RSD/helicopter main probe interface may be permitted.

4.157. **VERTREP Control Station Location and Field of View.** A VERTREP Control Station (VCS) shall be provided outside the periphery line markings of the VERTREP area, but from where the Helicopter Director (HD) shall have a clear view of the VERTREP area and the aircraft involved in the operation. The VCS shall be located such that it has ready access to the VERTREP area.

General Display Requirements

4.158. Displays shall be collocated as far as practicable, with the layout based upon a compromise of importance (safety), frequency of use, and logical grouping.

Superseded

4.159. Display panels shall be visible from the operator's normal operating position and orientation.

4.160. All displays shall have a wide adjustment of brightness in order to be readable from bright sunlight conditions down to very dark conditions.

4.161. If used at night, displays or control lighting in the Bridge, Landing Safety Officer (LSO) Station, FDO/FDM Station and Helicopter Control Station (HCS) shall comply with NVD Compatibility requirements for Category 'C' lights as defined in DEFSTAN 02-587.

4.162. Human factors design shall comply with DEF(AUST)5000 Vol 06 Pt 02 Sec 03.

General Control Requirements

4.163. All controls, indicator lamps, switches and switch positions shall be identified by appropriate nameplates or engraving, or graphical user interface (GUI) equivalent.

4.164. Dimmer/brightness controls for lights shall be designed to operate in a logical manner (e.g. to increase intensity rotate control knobs clockwise or slide upwards for a sliding control).

4.165. Switches and controls shall be operable with or without gloves (anti-flash).

General Requirements for Stations on Weather Decks

4.166. If the station (FDO/FDM, VERTREP, Transfer) is located on a weather deck, then:

(a) The control panels shall be watertight.

(b) Any displays shall be sunlight-readable.

(c) Any controls or equipment shall be secured so as not to create a Foreign Object Damage (FOD) hazard.

General Compartment Requirements for Aviation Stations

4.167. Area lighting in the HCS, LSO Station and Bridge (where the pilot may see the Bridge during approach) shall comply with NVD Compatibility requirements for Category 'C' lights as defined in DEFSTAN 02-587. This ensures that lights emanating from windows shall not degrade NVD images for aircrew, but also facilitate the use of NVDs by the HCO or deck staff, if desired.

4.168. Windows shall incorporate windscreen wipers, demisting and tinting consistent with the requirements of the Bridge windows detailed in DEF(AUST)5000 Volume 10, Part 2, paragraph 5.6.4.

Lighting Controls

4.169. The Helicopter Control Station shall include controls for all aviation lights and visual aids (such as SGSI), including intensity controls.

Superseded

Aircraft Controller (AC) Station

4.170. A dedicated AC control position shall incorporate a suitable helicopter control radar display. The display shall be integrated to the ship's Combat Management System located in the Operations Room. As a minimum, information shall include ship course and speed, ship position, helicopter identification, helicopter position and helicopter range and bearing to own ship. If available height shall also be displayed.

4.171. The display shall be equipped with suitable overlays or have an operator input facility for projection of standard helicopter approach patterns.

Explosive ordnance and flammables

4.172. **Forward Firing and High Explosive Weapon Loading.** Risks analysis associated with operating of forward firing and high explosive ordnance shall be conducted in accordance with eDEOP101 Reg 5.4 to define design requirements.

4.173. **Magazines and Ready Use Magazines.** Magazines and ready-use magazines of locker size shall not be located on exposed decks within the helicopter clearance envelope/s (Annex A). Ship's Helicopter Operating Instructions shall specify that all weather-deck ammunition magazines and ready-use lockers in the vicinity of the aircraft operating area shall be closed during helicopter operations. Requirements of DEF(AUST) 5000 Vol 6 Pt 05 Sect 03 shall be adhered to for magazine and ready use magazine design.

RADHAZ

4.174. **RADHAZ.** Emitter systems (RADAR, Communication, Laser systems) that may be hazardous to aircrew and aircraft shall comply with DEF(AUST) 5000 Volume 2 Part 11, ANP4411-1314 and AECP-2(C). Software RADHAZ controls shall also meet the requirements of DEF(AUST) 5000 Vol 2 Pt 14.

Aviation incident response

Safety and Rescue Facilities

4.175. **Flight Deck Crash Rescue Equipment.** Equipment shall be readily available at the flight deck of all air capable ships for the conduct of emergency rescue operations in support of aircraft which have crashed. Equipment scales are laid down NAP 7002.002-2M and ANP 4316.

Ditched Aircrew Rescue

4.176. **Crash Rescue Boat.** A ship's boat of inflatable, rigid inflatable or rigid hull design shall be designated as the crash rescue boat in all air capable ships.

4.177. All available ship's boats may be required for aircrew rescue. For the required speed of reaction, the designated crash rescue boat shall be immediately available and equipped for personnel rescue.

4.178. The crash rescue boat's minimum equipment requirements are listed in ANP 3300.

Superseded

4.179. The crash rescue boat shall be able to operate to the maximum sea state in which all required aircraft can conduct operations to the ship.

Crash Alarm

4.180. An aircraft crash alarm shall be installed with an actuating switch at the HCS, LSO Station, FDO Station and Bridge. A crash alarm switch shall also be installed at VERTREP or transfer Control Stations when the Bridge does not have a clear view of the VERTREP or transfer area. The switch shall be a stand-alone item and shall be clearly identified 'CRASH ALARM'. The alarm shall sound at all broadcast and alarms system speaker locations.

Control Stations and Windows Overlooking the Flight Deck

4.181. Control Station Bulkheads and Windows overlooking the flight deck shall be ballistic-resistant for the purpose of protecting occupants in the event of a helicopter crash. The ballistic protection characteristics shall comply with DEF(AUST) 5000, Volume 7, Part 23, Section 5, with aviation control stations for all ship types being classified as 'High Value Compartments' on Platform Type A ships to ensure fragment mitigation is included.

4.182. For windows mounted within the Flight Deck area (e.g. RAST Control Station) the window and frame structure shall be as a minimum, equally as strong in all respects as its deck surrounding structure.

Superseded

ANNEX A - OBSTRUCTION CLEARANCES

Obstruction clearances

Minimum Clearance Requirements for Single Spot Air Capable Ships

4.A.1. **Clearance Criteria for Landing and Launching Operations.** For a ship to be cleared and certified to land and launch a helicopter, certain minimum clearances within defined clearance areas and approach flight paths are required and shall be assessed separately for each helicopter type under consideration. The clearances given in this section are the minimums allowed for safe operations. Newly-designed flight-decks should aim for greater clearances than the minimum to promote safer and more capable aviation operations at sea.

4.A.2. **Scatter.** The obstruction clearance criteria described in this section is based upon the concept that during helicopter operations to ships, the helicopter position will vary each time from what may be considered an ideal approach/departure profile and landing position. The scatter may be classified into an airborne phase and a landing phase. The airborne phase applies during the approach to and departure from a point above the touchdown position. The landing phase applies to aircraft touching down on the flight deck.

4.A.3. **Airborne Scatter.** This is an allowance for deviation of the helicopter from the optimum flight path whilst positioning for landing or departing after take-off. The airborne scatter distance is determined by the rotor diameter of the helicopter. The scatter is applied along the fore-and-aft axis of the flight deck centreline; however, the associated clearance volume is considered to extend laterally to represent the aircraft transitioning left or right for departure (or for landings applicable to lateral approaches). The airborne scatter is defined in Table A-1 Airborne Scatter below.

Table A-1 - Airborne Scatter

Rotor Diameter	Airborne Scatter	
	Single Spot	Multi Spot
Up to 12.0 m (39 ft)	3.0m (10 ft)	2.4m (8 ft)
12.01 to 15.0 m (49 ft)	3.5m (12 ft)	2.7m (9 ft)
Over 15.01 m (49 ft)	4.5m (15 ft)	3.0m (10 ft)

4.A.4. **Landing Scatter.** This is an allowance for deviation of the helicopter from the optimum flight path immediately prior to touchdown and immediately post lift-off. The landing scatter distance is determined by the maximum AUW of the helicopter. It is applied along the fore/aft and lateral axes of the flight deck centreline. Table A-2 Landing Scatter defines the landing scatter.

Table A-2 - Landing Scatter

Maximum AUW	Landing Scatter

Superseded

	Single Spot	Multi Spot
Up to 5400 kg (12 000 lb)	2.4 m (8 ft)	1.8m (6 ft)
5400 kg (12 000 lb) and Above	3.0 m (10 ft)	2.4 m (8 ft)

4.A.5. **Heading Error.** Heading error is an allowance for deviation of the helicopter from the intended landing heading. It is superimposed on landing scatter to calculate all possible wheel landing positions. For all helicopters, the heading error is ±20°. Heading error shall be calculated using the main rotor centre as the point of rotation (or designed Yaw pivot point if different).

4.A.6. **Areas and Volumes.** The system for determining obstruction clearances involves four different areas. Each area has allowable obstruction heights. The approach to conceptualising the areas is to define a clearance volume that commences at a prescribed height above the flight deck and extend upwards. By applying such a volume to an existing 3D model of a ship, the compliance finder shall establish if there is an overlap between an obstruction and the clearance volume (ideally, there should not be any incursions into the clearance volume). The 'datum' for the construction of the volumes is the 'reference position'.

4.A.7. **Reference Position.** The reference position is the intersection of the fore/aft position line (also known as the Pilots Eye Line—PEL, or bum line) and the lateral line-up line painted on the flight deck. The pilot's eye line shall pass through the fore/aft position line, and the aircraft shall be centred on the lateral line-up line.

4.A.8. **Touchdown Clearance Area (TCA).** The Touchdown Clearance Area is that area of the flight deck within which the landing gear of a helicopter shall alight. It is centred on the optimum landing position, includes allowance for landing scatter and heading error, and ensures clearance from obstacles for the landing gear. Where essential and to the benefit of flight operations, obstructions to a maximum of 25 mm in height are permitted provided that they are contoured or faired and are shaped in such a fashion that they do not provide a hazard to aircraft wheels or to personnel. A top view of an MRH90 TCA on a generic flight deck is shown at Figure A-1 (A). (The base of the volume is 25 mm above the flight deck).

NOTE: *The deck edge is also considered to be an obstruction.*

4.A.9. **Fuselage Clearance Area (FCA).** The Fuselage Clearance Area is that area of the flight deck outside the TCA for which adequate obstruction clearance is provided for the main rotor, fuselage and the most rear part of the fuselage (or tail rotor) likely to strike the deck. It is centred on the optimum landing position and includes allowance for landing scatter and heading error. Where essential and to the benefit of flight operations, individual deck hardware smoothly contoured to a required minimum slope of 1 in 3 and not exceeding 0.11 m in height are permitted. Slope material shall be capable of withstanding aircraft landing forces. Where fitted, deck wash lights shall be installed on or outside the periphery line markings as close as possible to the deck edge and the adjusted height shall not exceed 0.30 m. A top view of an MRH90 FCA on a generic flight deck is shown at Figure A-1 (The base of the volume is 0.11 m above the flight deck).

4.A.10. **Fuselage and Tail Rotor Swept Area (FTRSA).** This is the area outside the FCA swept by the fuselage and tail rotor whilst positioning for landing or departing after take-off, having allowed for airborne scatter in the fore/aft axis. The FTRSA extends laterally infinitely on any side that the helicopter may launch or recover from. If the helicopter is constrained in a particular direction, then the clearance area shall extend a distance to account only for airborne scatter. For stern approaches,

Superseded

the FTRSA is also swept from the reference position infinitely aft, with airborne scatter in the lateral axis. Obstructions shall not exceed 0.61 m in height. A top view of an MRH90 FTRSA on a generic flight deck is shown at Figure A-1 (The base of the volume is 0.61 m above the flight deck).

4.A.11. **Main Rotor Swept Area (MRSA).** This is the area outside the FTRSA potentially swept by the main rotor whilst positioning for landing or departing after take-off, having allowed for airborne scatter. The MRSA extends laterally infinitely on any side that the helicopter may launch or recover from. If the helicopter is constrained in a particular direction, then the clearance area shall extend a distance to account only for airborne scatter. For stern approaches, the MRSA is also swept from the reference position infinitely aft, with airborne scatter in the lateral axis. Obstructions shall not exceed one eighth of the main rotor diameter or 1.5 m, whichever is the lesser. A top view of an MRH90 MRSA on a generic flight deck is shown at Figure A-1 (The base of the volume is 1.5 m above the flight deck).

Obstruction Clearances - Other design considerations

4.A.12. The optimal location of the reference position shall be determined by balancing the clearance between the MRSA and forward obstructions, with the requirement to access the tail rotor with the helicopter landed in the extreme aft position. Other considerations, such as detailed in 4.A.12 and 4.A.13 may bias the reference position to be further aft as well as considerations for enabling room for the deck team to stand during manned flight deck launches and recoveries. However, operational and maintenance considerations (such as troop movements, traversing equipment, lashing patterns etc) may bias the reference position to be further forward. Finally, the size of the flight deck may preclude access to the tail rotor for maintenance, with the requirement depending on the operational intent of the ship (for example, if the helicopter is intended only for launch and recovery operations on the vessel and not permanent embarkation tail maintenance may not be required). In this case, the design of the reference position shall ensure that the TCA is contained within the flight deck, and that the TCA and FCA clearances are complied with.

4.A.13. With the aircraft in the reference position, the pilots' field of view shall not be restricted by the ship superstructure by more than ±30°.

4.A.14. There shall be sufficient clearance between the main rotor and the aft superstructure to avoid recirculation effects between the main rotor and the superstructure.

4.A.15. Considerations for deck width and the periphery line markings shall ensure the FCA is contained within the flight deck (including where pylons/wings are fitted to the helicopter). Deck width shall enable manual blade fold requirements for primary aircraft with manual blade fold.

4.A.16. VERTREP Obstruction Clearance Criteria. VERTREP obstruction clearances shall be based upon the four obstruction clearance volumes as detailed in Table A-3 Application of Clearance Volumes to VERTREP Clearances where the height of the aircraft is offset vertically from the deck by 0.61 m for Class 4 VERTREP and by 3.71 m for Class 5 VERTREP.

Type of VERTREP	Application Clearance Volumes
Type 1	Apply TCA and FCA whilst centred over the VERTREP area, apply landing scatter and ±20° heading error, with the aircraft aligned athwartships. Apply FTRSA and MRSA with airborne scatter with the aircraft aligned athwartships, running athwartships along the VERTREP line. Offset the FTRSA and MRSA clearance volumes upward by 0.61m for Class 4 VERTREP and by 3.71 m for Class 5 VERTREP. (This allows for 0.89 m of vertical scatter during VERTREP).
Type 2	Apply TCA and FCA whilst centred over the VERTREP area, apply landing scatter and heading error from ahead ± 90°. Apply FTRSA and MRSA with airborne scatter and heading error from ahead ± 90° with the aircraft aligned forward, along the VERTREP line (running athwartships) Offset the FTRSA and MRSA clearance volumes upward by 0.61m for Class 4 VERTREP and by 3.71 m for Class 5 VERTREP. (This allows for 0.89 m of vertical scatter during VERTREP).
Type 2A	As per Type 2, using alternative Tee-Ball-lines as reference.
Type 3	Apply TCA and FCA whilst centred over the VERTREP area, apply landing scatter and heading error equating to retaining gearboxes within T-lines (aircraft nominally aligned athwartships). Apply FTRSA and MRSA, apply landing scatter and heading error equating to retaining gearboxes within T-line, running athwartships along the VERTREP line.

Superseded

	Offset the FTRSA and MRSA clearance volumes upward by 0.61m for Class 4 VERTREP and by 3.71 m for Class 5 VERTREP. (This allows for 0.89 m of vertical scatter during VERTREP).

4.A.17. **Transfer Obstruction Clearance Criteria.** The minimum hover height for Transfer shall be determined based on a hover position that maintains the aircraft clearance volumes (TCA, FCA, FTRSA, MRSA) free from obstructions offset by winch height and a component for vertical scatter.

4.A.18. **Clearance Requirements for a Midships Landing Area.** The obstruction clearance criteria detailed in paragraphs 4.A.2 through to 4.A.5, and 4.A.6 through to 4.A.11 shall be applied to midships landing areas.

4.A.19. **Clearance Criteria for Dual Main Rotor Helicopters operating to a Midships Landing Area.** Similarly, the obstruction clearance criteria detailed in 4.A.2 through to 4.A.5, and 4.A.6 through to 4.A.11 shall be applied to dual main rotor helicopters operating to a midships landing area, although the tail rotor dimensions shall be replaced by the rear main rotor and aft fuselage.

4.A.20. **Clearance Criteria for a Forward Landing Area.** The clearance requirements for a midships landing area shall be applied.

Obstruction Clearances - HIFR Obstruction Clearance Criteria

4.A.21. When a deck area is used exclusively for HIFR operations, the minimum area size, as defined by the outside dimensions of the periphery line markings, shall be 3.3 m2. The HIFR area shall be approximately square in shape. Within the periphery line markings, a block letter ‘H’ (as detailed in Figure 3 of parent document, or pictorially at Figure A-2 Combined Landing and Swept Areas shall be painted to designate the spot over which the helicopter shall lower its hoist in order to pick up the refuelling hose.

4.A.22. When located in a landing and/or VERTREP area, the HIFR pick-up spot shall be located on the port side.

4.A.23. The minimum hover height for HIFR shall be determined based on a hover position that maintains the aircraft clearance volumes (TCA, FCA, FTRSA, MRSA) free from obstructions. The minimum hover height shall be increased by 0.89 m to account for vertical scatter.

4.A.24. In addition, the area between the fuelling station and the pick-up point shall be clear of obstructions. Deck equipment and hardware shall not snag or damage the HIFR hose.

Superseded

ACRONYMS and GLOSSARY

Glossary

G.1. **Air Capable Ships.** Air capable ships are ships on which an aircraft can land and from which an aircraft can be launched, i.e. ships fitted with a flight deck. Ships must be certified to operate with particular types of aircraft.

G.2. **Aircraft Types to be operated.** The certification for aviation operations designated for a particular ship shall specify the type(s) of aircraft and the Level and Class to which each aircraft type is capable of operating.

G.3. **Flight deck.** The flight deck is the clear area of deck where air capable ships conduct helicopter operations including landing, take-off, parking and traversing. The flight deck area includes the total deck area outside of the helicopter landing area. The flight deck area shall provide the means to safely secure aircraft and equipment (e.g. stores and pallets) to the deck. Figure 2 depicts a typical flight deck.

G.4. **Fore/Aft Position Line.** The fore/aft position line is a line painted athwartships. It is designed to give the pilot a reference for correct fore/aft position on the flight deck. The correct fore/aft position shall provide optimal position for main rotor clearance and tail wheel position and shall align the RAST probe (if fitted) central over the Rapid Securing Device (RSD). The fore/aft position line shall extend past the deck edge by 'outriggers' on the flight deck nets and should extend beyond the edge of the flight deck nets. The fore/aft position line is also known as 'Pilots Eye Line' – PEL, 'bum-line', 'eyebrow' line.

G.5. **Fuselage Clearance Area (FCA).** The fuselage clearance area (FCA) is the area of the flight deck outside the touchdown clearance area (TCA) for which adequate obstruction clearance is provided for the main rotor, fuselage and the most rear part of the fuselage (including tail rotor) likely to strike the deck. The FCA includes allowance for landing scatter and heading error.

G.6. **Fuselage and Tail Rotor Swept Area (FTRSA).** The fuselage and tail rotor swept area (FTRSA) is the area outside the FCA swept by the helicopter's fuselage and tail rotor while it is positioning for landing or departing after take-off, having allowed for airborne scatter in the fore/aft axis. The FTRSA extends laterally beyond the ships edge on any side that the helicopter may launch or recover from to account for aircraft positioning prior to transition over the deck. If the helicopter is constrained in a particular direction, then the clearance area shall extend a distance to account only for airborne scatter.

G.7. **Helicopter In-Flight Refuelling (HIFR).** Helicopter in-flight refuelling is where a fuel line is winched up to a helicopter in flight and the crew refuel the aircraft in flight.

G.8. **Instrument Meteorological Conditions (IMC).** Meteorological conditions (where instrument flight rules apply) expressed in terms of visibility, distance from cloud, and ceiling, less than minimums specified for Visual Meteorological Conditions (VMC).

G.9. **Landing Area.** The area of the flight deck where the aircraft lands. This area consists of the TCA, FCA, FTRSA and MRSA. These areas are calculated for aft, midships and forward clearance for single and dual main rotor helicopters.

Superseded

G.10. **Main Rotor Swept Area (MRSA).** The main rotor swept area (MRSA) is the area outside the FCA and FTRSA potentially swept by the helicopter's main rotor whilst it is positioning for landing or departing after take-off, having allowed for airborne scatter. The MRSA extends laterally beyond the ships edge on any side that the helicopter may launch or recover from to account for aircraft positioning prior to transition over the deck. If the helicopter is constrained in a particular direction, then the clearance area shall extend a distance to account only for airborne scatter.

G.11. **Primary Aircraft.** The primary aircraft is the aircraft type for which the ship's aviation facilities were primarily designed to operate with.

G.12. **Reference Position.** Location of the fore/aft position line in the nominated position as described at Annex A.

G.13. **Ship Level** is determined by the type of environmental conditions in which the ship is capable and certified to conduct aviation operations:

(a) **Level I.** The ship's facilities shall be capable of supporting day and night helicopter operations in both Visual Meteorological Conditions (VMC) and Instrument Meteorological Conditions (IMC) for those helicopters so designated.

(b) **Level II.** The ship's facilities shall be capable of supporting both day and night helicopter operations under VMC only.

(c) **Level III.** The ship's facilities shall be capable of supporting day helicopter operations under VMC only.

G.14. **Ship Class.** Class indicates the operating capability of an air capable ship in respect of maintenance facilities and logistic support:

(a) **Class 1.** Landing area with full service and organisational level maintenance facilities for the specified aircraft to be operated on a continually embarked basis, with accommodation for flight personnel and dedicated stowage for the full entitlement of spares and support equipment. For other aircraft types that are cleared to the flight deck and can be hangared, the facilities and stowage's may not be specifically designed to accommodate that aircraft; however, a Class 1 facility may be afforded that ship-helicopter combination.]

(b) **Class 2.** Landing area with service facilities for the aircraft to be operated on a short–term embarked basis with accommodation for flight personnel and storage available for limited spares and support equipment. For embarkations longer than 72 hours, a hangar is normally required.

(c) **Class 2A.** Landing area with limited service facilities e.g. no aircraft power.

(d) **Class 3.** Landing area without service or maintenance facilities.

(e) **Class 4.** The ship has a VERTREP area with a maximum obstruction height of 1.52 m within fuselage and landing gear clearance zones and 4.6 m within the rotor clearance zone.

(f) **Class 5.** The ship has a VERTREP area with a maximum obstruction height of 4.6 m within fuselage and landing gear clearance zones and 7.6 m within rotor clearance zone.

(g) **Class 6.** The ship has a Helicopter In–Flight Refuelling (HIFR) capability.

(h) **Class 7.** The ship has a helicopter transfer facility for transferring personnel and light cargo (normally up to about 250 kg) by means of aircraft hoist or handline.

Superseded

G.15. **Touchdown Clearance Area (TCA).** The TCA is that area of the flight deck within which the landing gear of a helicopter shall alight. It is centred on the optimum landing position, includes allowance for landing scatter and heading error, and ensures clearance from obstacles for the landing gear.

G.16. **Transfer Capable Vessels.** Transfer capable vessels are those vessels which do not have a flight deck or suitable area for VERTREP operations but which still have a requirement for aviation operations in the form of light cargo or personnel transfer. These vessels normally have minimum equipment and an obstacle-free area that is suitable for Transfer operations.

G.17. **Unserviceability.** In the context of Ships Aviation Facilities, an unserviceability is a change to the ship's material state that affects the ability of the ship to meet the designated Level and/or Class. These unserviceabilities shall be reported to the Aerodrome Operator.

G.18. **VERTREP.** Vertical replenishment (VERTREP) is the external transfer of materiel to and from a ship from a hovering helicopter.

G.19. **Visual Meteorological Conditions (VMC).** Weather conditions in which Visual Flight Rules (VFR) apply, expressed in terms of visibility, ceiling height, and aircraft clearance from clouds along the path of flight.

Acronyms

G.20. The following acronyms are used in this chapter

AC	Aircraft Controller
AFFF	Aqueous Film Forming Foam

SUMMARY OF CHANGES INTRODUCED IN THIS ISSUE DATED 27 Feb 2025

This issue of the DASDRM incorporates changes as follows:

Section 5 Chapter 8 Air Navigations Systems – Introduction of new chapter

Superseded

Advisory Circulars and Factsheets

Advisory Circulars and Factsheets are sources of support material intended to promote understanding of, and compliance with, the DASR. All support material is authoritative information issued by DASA that does not mandate any action but which may address regulatory requirements and provisions established elsewhere. Other sources of support material include:

a. DASR Acceptable Means of Compliance

b. DASR Guidance Material

c. Defence Aviation Safety Program Manual Volume 3 DASP Guidance.

Advisory Circulars are typically issued to deliberately bring an issue to the attention of the target audience or to address a complex topic. ACs may be used to identify acceptable ways to achieve regulatory compliance, either as a temporary transition arrangement or in advance of promulgation as DASR Acceptable Means of Compliance.

Factsheets are typically issued to provide concise information that may assist those interested in a particular topic.

Advisory Circulars

Current ACs that do not have a hyperlink are only available on the Defence Intranet. To access, please visit the DASA Intranet page and select the 'Advisory Circulars (restricted)' menu item under the 'Policy and Guidance' tab.

AC Number	Title	Date Issued	POC	Comments
001/2024	Global Reporting Format - Runway Surface Condition	Sep 24	DAVNOPS

Factsheets

Topics:

- Aerodromes
- Air Cargo Delivery
- Certification
- Cyber Security
- General
- Maintenance Licensing and Training
- Production
- Uncrewed Aircraft Systems

Aerodromes
Aerodrome Design Requirements and Certification Basis

Superseded

Aerodrome Issue Paper
Applying for Certification
DASR 139 Aerodrome Certification Criteria
DASR 139 Aerodrome Certification Process
Defence Aerodrome Obstacle Management
Information Guide On Interpretation of CASA Part 139 MOS
Military Aerodrome Certification Review Items
Responsibility for the Design and Construction of Safe Aerodromes
Why Certify Defence Aerodromes Under DASR.139

Air Cargo Delivery
Management of Air Cargo Delivery Equipment

Certification
Air Launched Stores
Aircraft Eligibility for Performance Based Navigation and Reduced Vertical Separation Minimum Operations
ALSE vs Role Equipment vs PEE vs Cargo
Certification of ALSE
DASA Level of Involvement
Defence Long Range Operations (DLRO)
Management of Civil Derivative Aircraft Type Designs
Technical Evaluation of Role Equipment

Cyber Security
Establishing Protections Against Cyber Hazard to Aviation Safety

Superseded

General
Establishing Compliance With DASR
Guidance on the Use of Synthetic Aviation Turbine Fuels

Uncrewed Aircraft Systems
Airspace Considerations for UAS Operations - Entry Requirements
Initial and Continuing Airworthiness Requirements for Specific Category UAS

Cancelled ACs

To access a cancelled AC, please contact the POC indicated in the table below.

AC Number	Title	Date Issued	POC	Comments
008/2021	Interim arrangements for MAML discrepancies resulting from PMKeyS proficiency errors	Jul 23	DCA

009/2018	Addressing Service Release Requirements under DASR	Oct 18	DASA HQ	Now included within DASP Manual Volume 3 Chapter 8.3.4
008/2018	Acceptance of Aircraft Components	Sep 18	DASA HQ	Now included within DASP Manual Volume 3 Chapter 8.3.4
007/2018	Line and Base Maintenance	Sep 18	DASA HQ	Now included within DASP Manual Volume 3 Chapter 8.3.2
006/2018	Certificate of Release to Service Responsibilities For Maintenance Organisation and CAMOs	Sep 18	DASA HQ	Superseded by AC 005/2020
005/2018	Management of Defects	Sep 18	DASA HQ	
004/2018	Airworthiness Recognition in the DASP	Sep 18	DASA HQ	Now included within DASP Manual Volume 3 Chapter 6.5
002/2018	Application For Military Type Certificates and Major Design Changes	Sep 18	DASA HQ	Now included within DASP Manual Volume 3 Chapter 7.2
006/2017	Military Type Certificate Holder Arrangements	Oct 17	DASA HQ	Now included within DASP Manual Volume 3 Chapter 7.4.1
005/2017	Authorisation of Flight for Non-Standard Changes to Configuration, Role and Environment	Sep 17	DASA HQ	Superseded by AC 005/2018
003/2017	DASR Implementation of Military Permits to Fly	Oct 17	DASA HQ	Now included within DASP Manual Volume 3 Chapter 7.5
001/2017	DASR Transitional Guidance	Jun 17	DASA HQ	
002/2016	Aviation Command Responsibilities under DASR	Sep 16	DAVNOPS	
001/2016	Airworthiness Nomenclature under DASR	Aug 17	DAVNOPS	

Superseded

Cancelled Factsheets

The following Factsheets have been cancelled and the content contained within has been published in DASP Manual Volume 3.

Certification	
Successful Applications for Flight Conditions and Military Permits To Fly	Chapter 7.5 Annex
Tailoring a Type Certification Basis and Military Certification Review Items	Chapter 7.2 Annex A
Operational Controls and Risk Management Associated with Type Certification Basis (TCB) Tailoring	Chapter 7.2 Annex A
Leveraging Prior Certification	Chapter 7.2 Annex B
Airworthiness Issue Papers (AwIPs)	Chapter 6.1.2 Annex C
Military Supplemental Type Certificates	Chapter 7.2.3
Certification Programmes	Chapter 7.2.2
Instructions for Continuing Airworthiness (ICA)	Chapter 7.2.5
Propulsion System Related Risk Analysis in Defence	Chapter 7.2 Annex E
Reclassification of Design Changes Requiring Type Certification Basis (TCB) Tailoring	Chapter 7.2.3

Maintenance Licensing and Training	
Military Aircraft Type Ratings	Chapter 8.5.8
DASR 147 Personnel Requirements	Chapter 8.5.3
DASR 147 Military Aircraft Type Training Levels Vs Service Learning Levels	Chapter 8.5.8
Defence Approach to Aircraft Welding Repair Training Qualification and Renewal	Chapter 8.3.2

Non-Destructive Testing and Composite Technologies

Superseded

Appointment of Non Destructive Testing Responsible Level 3 in DASR 145 Maintenance Organisations	Chapter 4.2.3
Non-Destructive Testing Instructions for Continuing Airworthiness (ICA)	Chapter 7.2.5
Non-Destructive Testing Standards Requirements	Chapter 8.3.2
Composite Repair Training and Certification	Chapter 4.2.3 Chapter 8.3.2
Defence Approach to Non-Destructive Testing Training and Certification	Chapter 4.2.3 Chapter 8.3.2

Production
Production Assurance in the DASP
Production of Software

Superseded

Glossary

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Superseded

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Superseded

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Superseded

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Superseded

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Superseded

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Superseded

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Superseded

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Superseded

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Superseded

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include,

Superseded

but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Superseded

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Superseded

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Superseded

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Superseded

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a ‘cabin altimeter’.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Superseded

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Superseded

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Superseded

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Superseded

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Superseded

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Superseded

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Superseded

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Superseded

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Superseded

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

Superseded

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

Superseded

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Superseded

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Superseded

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

Superseded

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Superseded

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

Superseded

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Superseded

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Superseded

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Superseded

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Superseded

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Superseded

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Superseded

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

Superseded

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

Superseded

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.
2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Superseded

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Superseded

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Superseded

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Superseded

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Superseded

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Superseded

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Superseded

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Superseded

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Superseded

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Superseded

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

‘Should’ is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the ‘tail number’ and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Superseded

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Superseded

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

Superseded

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Superseded

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a ‘system’, within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

Superseded

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Superseded

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

Superseded

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Superseded

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a 'model'. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Airworthiness Standards *

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Basic Aircrew Qualification *

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Basic Flight Trainer (BFT) *

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Basic Regulation

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Cabin Altitude *

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Certification

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Cockpit Voice Recorder (CVR) *

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

Definitions with no superscript have been sourced directly from the European Military Airworthiness Document (EMAD 1). Those definitions and terminologies with a superscript * are DASP specific and have been derived or contextualised for Australian use by the Defence Aviation Safety Authority (DASA).

2D Approach Operation *

An approach conducted by reference to instrument displays that provide lateral (directional) navigation information. This includes all Non-Precision Approaches (NPA) flown without requiring reference to vertical navigation guidance.

3D Approach Operation *

An approach conducted by reference to instrument displays that provide both lateral (directional) and vertical navigation information. This includes all Precision Approaches (PA) and Approach Procedures with Vertical guidance (APV) using Satellite Based Augmentation System (SBAS) or Barometric Vertical Navigation (Baro-VNAV). A 3D approach operation is characterised by a Decision Altitude (DA) and does not have a Missed Approach Point.

Above Obstacles (AO) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface.

Acceptable Means Of Compliance (AMC) *

Information published by DASA to identify a means of meeting one or more requirements of the DASR. Regulated entities are not required to comply with AMC and may instead propose an Alternative Means of Compliance (AltMoC) to DASA. Any such proposal will be subject to separate assessment by DASA to determine whether the approach is compliant with the DASR.

Acceptance Test And Evaluation (AT&E) *

An acceptance function used by Defence to verify that a system complies with the defined acceptance requirements. AT&E is used to establish specification compliance and verify airworthiness.

Accountable Manager (AM) *

Person designated by the Approved Organisation, and identified in the Organisation Exposition or Compliance Statement, who is accountable for maintaining safety standards required by relevant DASR and any additional standards specified. Typically, this is a key figure who has influence within the organisation and the ability to make appropriate resource decisions.

Superseded

ACD Equipment*

Equipment employed in ACD via Airdrop, Airland and External Lift on transport or rotary wing Aircraft; including ADE, pallets, restraint devices, chains, straps, nets and loading devices.

Adequate Aerodrome *

An aerodrome on which an aircraft can be operated, taking account of the applicable performance requirements, runway characteristics and other relevant support facilities and services.

ADF Cadets *

A collective reference to the three cadet organisations, namely, the Australian Navy Cadets, Australian Army Cadets and Australian Air Force Cadets (Defence Act 1903, section 62).

Advisory Circular (AC) *

A document issued by the Authority to promulgate important information to the Defence Aviation regulated community but does not mandate any action.

Advisory Material

Material that provides interpretation of technical airworthiness requirements and standards to assist in understanding and implementation. It also provides guidance on methods and procedures that are in compliance with technical airworthiness requirements and standards. Advisory material, including the described methods and procedures, is not mandatory and organisations may choose to follow other means of demonstrating compliance.

Aerial Delivery *

The process of dispatching cargo or stores from an operating aircraft in flight.

Aerial Delivery Equipment

Equipment employed on transport or rotary wing Aircraft in the aerial delivery of materiel; including slings, platforms, containers, parachutes, rigging materials, cloths, cords, tapes, threads and webbing (Note: Aerial delivery equipment does not include equipment employed in the aerial delivery of personnel).

Aerodrome (AD) *

A defined area on land or water (including any buildings, installations, and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of fixed wing and rotary wing aircraft.

Superseded

Aerodrome Apron Areas *

The surfaces intended to accommodate aircraft for purposes of loading or unloading air cargo, passengers, fuelling, parking or maintenance, excluding hangars.

Aerodrome Certificate *

A certificate granted to an Aerodrome Operator by the Authority under DASR 139 that certifies the aerodrome meets the technical specifications outlined in its certification basis.

Aerodrome Manager (ADM) *

The representative of the Aerodrome Operator, responsible for ensuring:

a. a Certified Aerodrome continues to maintain its certified status; and

b. for non-certified aerodromes, the aerodrome is safe and fit-for-purpose as required.

Aerodrome Manoeuvring Areas *

The surfaces of the aerodrome used for the take-off, landing, and taxiing of aircraft, excluding aprons.

Aerodrome Movement Areas *

A term describing the combined manoeuvring areas and apron areas, excluding hangars.

Aerodrome Operator (AD OPR) *

The Defence organisation accountable for the overall safe operations of a Defence Aerodrome.

Aerodrome Rescue And Fire Fighting (ARFF) *

A service whose principal objective is the preservation of life and materiel in the event of an aircraft accident or incident occurring at, or in the immediate vicinity of, an aerodrome.

Aeronautical Data

A representation of fact, concepts or instructions in a formalised manner suitable for communication, interpretation or processing.

Aeronautical Data Originator*

An entity responsible for providing source Aeronautical Data and Aeronautical Information to AIS providers for publication in the Integrated Aeronautical Information Package and on aeronautical charts.

Superseded

Aeronautical Information *

Information and other required data necessary for the safety and efficiency of air navigation.

Aeronautical Information Service (AIS)

A service established within the defined area of coverage responsible for the provision of Aeronautical Data and Aeronautical Information necessary for the safety, regularity and efficiency of air navigation.

Aeronautical Life Support Equipment (ALSE) *

Safety or mission equipment to be carried or worn by crew or passengers when operating aircraft in a military configuration, role or environment.

Aeronautical Product *

Includes type-certificated or restricted type-certificated aircraft, engines, propellers and AUSMTSO approved Auxiliary Power Units (APU).

Aeroplane *

A power-driven heavier-than-air aircraft deriving its lift in flight chiefly from aerodynamic reactions on surfaces remaining fixed under given conditions of flight, but does not include a power-assisted sailplane.

Air Battle Management (ABM)*

The control of military air operations that may include the control and coordination of integrated air and missile defence, offensive counter-air, strategic attack, close air support and other warfighting or supporting air activities.

Air Battle Management Operations (ABMOps)*

Those ABM operations provided to military operations as defined in the Air Battle Management Operator Certificate (ABMOC) and the accompanying Operations Specification (OpSpec).

Air Battle Management Operator (ABMO)*

A generic term for an organisation certified by a Military Aviation Authority (MAA) to conduct Air Battle Management.

Superseded

Air Battle Management Operator Certificate (ABMOC)*

A certificate issued by DASA to authorise an Air Battle Management Operator (ABMO) to provide Air Battle Management Operations (ABMOps) as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Air Capable Ship *

A sea based facility from which aircraft can take-off, be recovered, or routinely receive and transfer logistic support.

Air Cargo Delivery (ACD)*

A process that involves the loading (including the preparation, composition, configuration, placement and restraint) of air cargo, whatever it may be (including Passengers, freight, paratroopers, animals and EO materials) and the subsequent unloading of that air cargo—either on the ground, surface or while in the air. ACD includes Airland, Airdrop and External Lift.

Air Cargo Delivery Service Provider (ACDSP)*

An organisation approved by DASA to provide an Air Cargo Delivery (ACD) service to a defined scope.

Air Cargo Delivery Service Provider Certificate (ACDSPC)*

A certificate issued by DG DASA to authorise an Air Cargo Delivery Service Provider (ACDSP) to provide Air Cargo Delivery (ACD) Services as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR ACD.

Air Display*

Any event, or rehearsal for any event, at which Display Flying or Flypasts, are deliberately performed for the purpose of providing an exhibition of Defence Aviation's capabilities, values and professionalism.

Air Force Interoperability Council (AFIC) *

An international organisation which provides a framework for the air forces of Australia, Canada, New Zealand, United Kingdom and United States to work collaboratively to enhance coalition expeditionary air and space interoperability.

Air-Launched Store

An aircraft store able to be intentionally separated from the aircraft in flight.

Superseded

Air Navigation Service Provider Certificate *

A certificate issued by the Defence AA to authorise an Air Navigation Service Provider (ANSP) to provide Air Navigation Services (ANS) as defined in the accompanying Service Provision Conditions (SPC) and in accordance with DASR.

Air Navigation Services (ANS) *

Those services provided to air traffic during all phases of operations (approach, aerodrome and enroute). ANS comprises Air Traffic Management (ATM), Communication Navigation Surveillance (CNS) systems services, Meteorological Services for air navigation (MET), Aeronautical Information Services (AIS), Aeronautical Data services (DAT), Flight Procedure Design Services (FPD) and ATM network functions.

Air Navigation Services Provider (ANSP) *

A generic term for an organisation certified by a National Aviation Authority (NAA) and / or a Military Aviation Authority (MAA) to provide an Air Navigation Service.

Air Operator Certificate (AOC) *

A certificate granted by a National Aviation Authority permitting the conduct of commercial flying activities.

Air Traffic Advisory (ATA) *

An ATS subcategory provided within advisory airspace to help ensure separation, in so far as is reasonably practicable (SFARP), between aircraft through the provision of advisory information that may be used by pilots to avoid collision with other aircraft.

Air Traffic Control (ATC) *

A service provided for the purpose of:

a. preventing collisions between aircraft

b. on the manoeuvring area, preventing collisions between aircraft and obstructions

c. expediting and maintaining an orderly flow of air traffic.

Air Traffic Control Service *

A service provided for the purpose of:

(a) preventing collisions between

i. aircraft

ii. aircraft and obstructions on the manoeuvring area

Superseded

(b) expediting and maintaining an orderly flow of air traffic.

The Air Traffic Control Service comprises any one or combination of: an area control service, an approach control service and an aerodrome control service.

Air Traffic Management (ATM) *

A generic term encompassing the dynamic, integrated management of air traffic and airspace in a safe, economical and efficient manner through the provision of facilities and seamless services in collaboration with all parties involving airborne and ground-based functions. The three subsets of ATM are Air Traffic Services (ATS), Airspace Management (ASM) and Air Traffic Flow Management (ATFM), although only ATS is regulated under DASR.

Air Traffic Management Network Functions*

Provision of the information communications technology network that connects the range of ATM systems.

Air Traffic Management Plan (ATMP) *

A plan that outlines the systems and processes that will be used to ensure the safe operation of Uncrewed Aircraft Systems (UAS) in conjunction with other air traffic.

Air Traffic Services (ATS) *

A term which collectively encompasses the Air Traffic Control Services (area control service, approach control service and aerodrome control service), an air traffic advisory service, an alerting service, a flight information service and battlefield airspace control.

Air Vehicle Operator (AVO) *

A qualification awarded to a trained and competent individual who controls a Certified, Specific or Open Category UAS during flight time.

Aircraft *

Any machine or craft, including an uncrewed machine or an uncrewed craft, that can derive support in the atmosphere from the reaction of air, other than reactions of the air against the earth's surface (Civil Aviation Act 1988, section 3).

Aircraft Altitude *

The vertical distance above mean sea level as indicated by an externally sourced altimeter set to either QNH (atmospheric pressure adjusted to sea level) or standard pressure of 1013.2 millibars, as appropriate to the procedures being used.

Superseded

Aircraft Captain *

A pilot designated as being in command and charged with the safe and effective conduct of the aircraft during flight. Analogous with the civil term 'pilot–in–command'.

Aircraft Controller *

A generic term used by aviation medicine describing those specialist personnel who may issue control or advisory information to aircraft that the pilot may base flight decisions upon.

Aircraft Flight Manual (AFM)

A manual, associated with Military Type Certificate, containing limitations within which aircraft is to be considered airworthy, and instructions and information necessary to the flight crew for the safe operation of the aircraft.

Aircraft Maintenance Programme

A document which describes or incorporates by reference the specific scheduled maintenance tasks and their frequency of completion, the associated maintenance procedures and related maintenance standards and practices necessary to preserve the airworthiness of those aircraft to which it applies.

Aircraft Oxygen System *

A means to store and supply aviators' breathing oxygen.

Aircraft Propulsion System *

The aircraft propulsion system includes, but is not limited to, the engine and propeller, including sub-systems, accessories and controls.

Aircraft Stores *

Any devices, excluding air cargo, intended for internal or external carriage and mounted on aircraft suspension and release equipment, whether or not the items are intended to be separated in flight from the aircraft. Aircraft Stores include missiles, rockets, bombs, mines, torpedoes, gun ammunition, grenades, pyrotechnic devices, sonobuoys, signal underwater sound devices, fuel and spray tanks, dispensers, pods (refuelling, thrust augmentation, gun, electronic countermeasures, etc), targets, chaff and flares from countermeasures dispensing systems, and suspension equipment (racks and pylons).

Aircraft Stores Compatibility

The ability of an aircraft, stores, stores management systems, and related suspension equipment to coexist without unacceptable effects of one of the aerodynamic, structural, electrical, or functional characteristics of the others under all flight and ground conditions expected to be experienced by the aircraft-store combination. A particular store may be compatible with an aircraft in a specific

Superseded

configuration, although not necessarily so with all pylons (or stations) under all conditions.

Aircraft Structure *

Aircraft components that are required to carry loads in order to perform their intended functions. The structure of an aircraft includes the fuselage, wing, empennage, landing gear, helicopter rotor and drive systems, control systems and surfaces, engine mounts, radome, nacelles, inlets, store mounts, structural operating mechanisms and other components that perform a structural function.

Aircrew *

A generic term describing personnel whose primary duties are conducted within the confines of an aircraft during flight time. Aircrew are deemed passengers unless authorised as crew or as a mission essential passenger for the specific aviation mission.

Aircrew Instructor *

A generic term describing a crew member who is qualified and authorised to deliver instruction in the airborne simulated or airborne environment.

Airdrop

Delivery of personnel or cargo from Aircraft in Flight.

Airland

The delivery of personnel, materiel or forces from an Aircraft after it has landed.

Airside *

The movement area and other facilities or zones on the aerodrome vital to the safe operation of aircraft and the personnel working with those aircraft.

Airside Breach *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person beyond the designated airside protected area.

Airspace *

The zone next to the earth consisting of atmosphere capable of sustaining flight.

Superseded

Airspace Management *

The design, allocation, integration, and regulation of airspace, including the application of airspace usage procedures to ensure the airspace is appropriate for the mission or activity.

Airworthiness

The ability of an aircraft, or other airborne equipment or system, to operate in flight and on ground without significant hazard to aircrew, ground-crew, passengers (where relevant) or to other third parties.

Airworthiness Board (AwB) *

An independent board of review appointed by the Defence AA to advise and make recommendations on airworthiness certification and to review the in-service management of Aviation Systems.

Airworthiness Codes

Product airworthiness requirements, applicable to the design of a product, that are approved by a competent airworthiness authority for the use with standardised aircraft categories Examples include, but not limited to EASA Certification Specifications (CS), FAA Federal Aviation Regulations (FAR) and Standardisation Agreements (STANAG) and Defence Standards (DEF STAN).

Airworthiness Directive (AD)

A document issued or adopted by the Authority which mandates actions to be performed on an aircraft to restore an acceptable level of safety, when evidence shows that the safety level of this aircraft may otherwise be compromised.

Airworthiness Limitation (AwL) *

An item arising from the certification process that has been shown to have failure mode(s) associated with an unsafe condition. The terms Airworthiness Limitation Item or Airworthiness Limitation Instruction are also used in certain sections of the implementing regulations.

Airworthiness Standards *

Detailed and comprehensive design and safety criteria applicable to the category of aeronautical product (aircraft, engine or propeller).

Alerting Service *

An ATS subcategory provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organisations as required.

Superseded

Alternative Means Of Compliance (AltMoC) *

An alternative to an Acceptable Means of Compliance or a means of complying with a requirement for which no AMC exists. The entity proposing the AltMoC must demonstrate to DASA that it satisfies the regulation.

Application Identifier (AI) *

The A or N prefix of the Australian military aircraft registration number. For example, A41 for C–17 Globemaster III, N48 for MH–60R Seahawk.

Approved Organisation

That which has been assessed by the Authority and deemed to meet their applicable regulations or requirements.

Area Navigation (RNAV)

Method of navigation that permits aircraft operation on any desired flight path within the coverage of ground-based or spaced-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note: *Area navigation includes PBN as well as other operations that do not meet the definition of PBN.*

Area Safe Height (ASH)*

The lowest altitude which will provide safe terrain clearance within a defined area.

Artefact

An airworthiness related document, either hardcopy or electronic, that can be used as evidence in making an airworthiness judgement.

Authorised Maintenance Data (AMD) *

Those instructions, approved for use by the responsible Authority, required to retain aircraft and aircraft-related equipment in an airworthy condition. These instructions include, but are not limited to, maintenance manuals, technical maintenance plans, servicing schedules, component lifing policies and inspection programs.

Authority To Operate (AUTHOP) *

Authorisation to operate a non-Defence registered aircraft.

Superseded

Autonomous Aircraft *

An uncrewed aircraft that does not require pilot intervention in the management of flight.

Autonomous Operation *

An operation during which an uncrewed aircraft is operating without pilot intervention in the management of flight.

Aviation Fatigue Management (AVFM) *

The management of fatigue in a manner appropriate to the level of risk exposure and the nature of the task or operation, in order to minimise the adverse effects of fatigue on safety during those activities.

Aviation Medical Certificate *

A document provided by an AVMO attesting to the medical fitness of a person to conduct flying related duties.

Aviation Medical Officer (AVMO) *

A medical practitioner who is recognised by Surgeon General–ADF as being appropriately trained and authorised to provide aviation medicine support to Defence Aviation.

Aviation Medicine (AVMED) *

The component of military medicine that is concerned with the interaction between the aerospace environment and human physiology, psychology and pathology.

Aviation Physiology Training Officer (APTO) *

A person who is recognised by a Single Service Aviation Medical Advisor (SSAMA) as being appropriately trained and authorised to provide supplemental aviation medicine training support.

Aviation Safety *

A state in which risks to personnel arising from aircraft operations are eliminated or otherwise minimised so far as is reasonably practicable through a continuing process of hazard identification and safety risk management.

Aviation Safety Acquisition Management Plan (ASAMP) *

A document that describes the safety strategy to introduce an aircraft type into Defence service. May include the safety strategy to achieve airworthiness, manage flight operations, and achieve broader capability/logistics milestones

Superseded

Aviation Safety Event *

Any event where an aviation system (including the human element) fails to perform in the expected manner and, adversely affects, or could adversely affect, the safety or airworthiness of an aviation system or third party.

Aviation Safety Issue *

A characteristic of an organisation or a system that can reasonably be regarded as having the potential to adversely affect the safe operation of an aircraft, aviation-related equipment or products and services.

Aviation Safety Management (ASM) *

A function integral to safe flying operations and requires processes and procedures to ensure competence of commanders and all personnel associated with flying operations, adherence to authorised orders and instructions, promotion of and maintenance of high levels of aviation safety awareness, and systematic evaluation and management of risk in operations.

Aviation Safety Management System (ASMS) *

A systematic approach to managing aviation safety, including the necessary organisational structures, accountabilities, policies and procedures. Reference to SMS in DASR means ASMS unless expressly stated to the contrary.

Aviation System *

The integration of equipment, personnel, organisation, publications and procedures to achieve an aviation role. Aviation systems include: Defence registered aircraft types, non-Defence registered aircraft types, Uncrewed Aircraft Systems (UAS).

Base Maintenance

Maintenance tasks falling outside the criteria for Line Maintenance.

Basic Aircrew Qualification *

The qualification aircrew are awarded upon becoming Type Rated.

Basic Flight Trainer (BFT) *

A device, which does not meet the requirements for categorisation as a Flight Simulator / Flight Simulator Training Device, approved for the purpose of permitting experience acquired therein to be credited towards meeting a sub-set of requirements for aircrew qualification, categorisation or currency.

Superseded

Basic Regulation

The DASR Basic Regulation was withdrawn on 01 September 2022. Its purpose was to establish a framework for the definition and implementation of common safety requirements and administrative procedures in the field of military aviation.

Battlefield Airspace Control (BAC) *

An Air Traffic Service (ATS) subcategory provided in assigned airspace that supports the air, land or amphibious scheme of manoeuvre by providing airspace management, coordination and de–confliction of joint fires and effects in that airspace in order to facilitate safe and efficient access to airspace through a combination of coordination with adjoining civil/military agencies and through the application of both procedural and positive control methods.

Cabin Altitude *

The pressure altitude inside the pressure hull of the aircraft and as indicated on a 'cabin altimeter'.

Category Assessor *

An experienced aircrew member who is qualified and authorised for the purpose of operational training and assessment of other aircrew within the same Basic Aircrew Qualification.

Certificate Of Airworthiness (CoA) *

A certificate issued to aircraft which conform to a type certificate that has been issued in accordance with DASR.21 (or if appropriate and if national regulations allow, based upon a Civil Type Certificate issued by a recognised Civil Authority.

Certificate Of Release To Service (CRS)

This is a statement, signed by an appropriately authorised person, on behalf of an approved organisation, which asserts that maintenance has been properly carried-out.

Certification

Recognition that a product, part or appliance, organisation or person complies with the applicable airworthiness requirements followed by the declaration of compliance.

Certification Maintenance Requirements (CMR) *

Scheduled maintenance that is required by the design to help show compliance with the appropriate type certification basis by detecting the presence of a safety-significant latent failure that would result in a hazardous or catastrophic failure condition.

Superseded

Certification Privileges *

The authority to issue a Certificate of Release to Service (CRS). Where on-aircraft maintenance has occurred, the CRS must be issued by the holder of a relevant MAML. Component certifying staff must be authorised by the maintenance organisation on the basis of appropriate competence, training and experience in accordance with a procedure(s) contained in the MOE. Individuals issuing a CRS for components are not required to hold a MAML.

Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate is in force.

Certified Life Limit For Components *

Specified life limit after which the components should be retired.

Certifying Staff

Personnel responsible for the release of an aircraft or a component after production and/or maintenance.

Charter *

The commercial renting of a complete aircraft, crew and maintenance system for tasking undertaken within the bounds of a legally binding contract.

Check Captain *

An experienced Aircraft Captain who is qualified and authorised for the purpose of assessing operational flying skills of other pilots.

Chief Executive Officer (CEO)

Person who is responsible for a civil company within which the Approved Organisation operates. The CEO may report to a board of directors and may appoint other managers, or they may be one of very few people in a small company. In relation to EMAR/DASR, the CEO is mentioned as they may be senior to the Accountable Manager.

Civil Aviation Authority (CAA)*

The governmental entity or entities, however titled, that are directly responsible for the regulation of all aspects of civil air transport, technical (i.e. air navigation and aviation safety) and economic (i.e. the commercial aspects of air transport). Source: ICAO Doc 9734 Safety Oversight Manual Part A.

Superseded

Civil Register *

The CASA-maintained Australian civil aircraft register. Aircraft on this register are referred to as civil registered aircraft and will be appropriately marked with a 'VH' registration (e.g. VH-ABC). This may be extended to include similar registers maintained by other NAA.

Civil Registered Aircraft *

An aircraft that is registered by a National Airworthiness Authority.

Cockpit Voice Recorder (CVR) *

A device that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the cockpit and communications to, from and between the flight crew members.

Command And Control (C2) Link (UAS Context) *

The data link between a remotely piloted aircraft and a remote pilot station for the purposes of managing flight.

Command Clearance *

An approval to deviate from an aviation system's approved configuration, role, environment, limitation or condition, when mission requirements cannot be achieved otherwise.

Communications, Navigation and Surveillance Systems (CNS Services)*

Services to ensure the availability, continuity and effective performance of Communications, Navigation and Surveillance systems which are used, or intended to be used, in the delivery of an ANS.

Competency *

The capacity of an individual to effectively and safely complete a task consistently, to a required standard of performance, through the application of appropriate skills, knowledge and attitude.

Compliance Demonstration

Activities to demonstrate that the product, part or appliance complies with the requirements in the Certification Basis.

Component Maintenance Manual (CMM)

A formal document which details the way in which off-aircraft maintenance instructions on the specified component shall be accomplished.

Superseded

Concern (Independent Board Of Review) *

A review finding which identifies a critical aviation safety issue that requires immediate action, and if not resolved by a specified date, will highly likely result in the limitation or withdrawal of aviation safety Instruments.

Configuration *

The functional and physical characteristics of existing or planned hardware, firmware, software or a combination thereof, as set forth in technical documentation (which includes specifications, standards and drawings) and ultimately achieved in a product.

Configuration Control

A systematic process that ensures that changes to released configuration documentation are properly identified, documented, evaluated for impact, approved by an appropriate level of authority, incorporated, and verified.

Configuration Item (CI)

Any component, module, sub-component, equipment, technical manuals, software, ground support equipment, which can be submitted to the configuration control process.

Configuration Management

A management process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design and operational information throughout its life.

Configuration Role and Environment (CRE)*

The configuration (physical and functional attributes of the aircraft), role (how the aircraft is flown and employed) and environment (the physical and functional conditions in which the aircraft is operated); as specified in an aviation system's Statement of Operating Intent and Usage (SOIU).

Consequence *

The outcome of an event or situation expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain.

Contemporary Crash Protection Design Requirement (CCPDR) *

Design requirements prescribed by a National Aviation Authority (NAA) and /or a Military Aviation Authority (MAA), which form the basis to certify the aircraft Type.

Superseded

Continued (Design) Airworthiness

All tasks to be carried-out to verify that the conditions under which a type- certificate or a supplemental type-certificate has been granted continue to be fulfilled at any time during its period of validity.

Continuing Airworthiness

All of the processes ensuring that, at any time in its operating life, the aircraft complies with the airworthiness requirements in force and is in a condition for safe operation.

Continuing Airworthiness Management Organisation (CAMO) *

Organisation approved by the Authority that ensures on behalf of the Military Air Operator (MAO), that each aircraft they manage is of the approved configuration available to meet the intended purpose and safe to fly.

Continuing Airworthiness Manager (CAM) *

Person designated by the MAO Accountable Manager to be responsible for the management and supervision of MAO continuing airworthiness activities.

Co–Pilot *

A pilot qualified and authorised to manipulate the flight controls of an aircraft during flight under the command of an Aircraft Captain.

Corrective Maintenance *

Those maintenance tasks necessary to restore items to a specified condition or to restore them to serviceability after failure.

Crash Protection (CP) *

Requirements designed to protect occupants and improve the chances of survival, during the initial impact phase as well as subsequent evacuation and post evacuation phases of a survivable crash.

Crew *

Competent and authorised individuals, including personnel authorised to undertake aircraft type qualification training, who may operate or interface with an aircraft's systems during flight specific aviation mission, including temporary equipment installations. Crew is broken into subsets of flight crew and mission crew.

Superseded

Crew Station *

A position, seated or otherwise, within an aircraft from which a crew member may perform an operational function.

Critical Design Configuration Control Limitations (CDCCL) *

These identify the critical design features such as proper wire separation, proper installation of a panel gasket, maximum acceptable bonding jumper resistance levels, etc., that must be maintained in exactly the same manner throughout the life of the aircraft in order to comply with the type certificate and maintain airworthiness. The purpose of CDCCL is to provide instructions to ensure these critical features are present throughout the life of the aircraft and are inspected and verified when alterations, repairs, or maintenance actions occur in the area.

Critical Infrastructure * (UAS Context)

A facility that, if damaged by an Uncrewed Aircraft (UA), may have an immediate and adverse effect on Mission Essential Personnel (MEP) or General Public (GP) health and safety.

Critical Parts *

Critical parts are identified by the design approval holder in accordance with the applicable Type Certification Basis requirements. Critical parts include, but are not limited to, those parts required to be identified by the following airworthiness code clauses: FAR / CS 27.602, FAR / CS 29.602, FAR 33.70 (termed engine life-limited parts), CS-E 515, FAR 35.16, CS-P 150 and CS-APU 210.

Critical Phase Of Flight *

A phase of flight determined by aircraft specific orders, instructions and publications (OIP) whereby only essential duties for the safe operation of the aircraft are permitted.

Currency *

A prescribed period during which a qualification or skill is valid without further assessment.

Dangerous Goods *

Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in authoritative technical instructions or which are classified according to those instructions. Dangerous goods include explosives, flammable liquids, gases, corrosives and chemically reactive or acutely (highly) toxic substances. Authoritative technical instructions include ICAO – Technical Instructions for the Safe Transport of Dangerous Goods by Air and IATA –- Dangerous Goods Regulations (DGR) Manual.

Superseded

Data Integrity

Assurance that Aeronautical Data and its value has not been lost or altered since the data origination or authorised amendment.

Data Services*

The provision of aeronautical databases either directly to aircraft operators for loading into air or ground-based mission systems, or to Aeronautical Information Services providers. This Aeronautical Data does not include data not specifically relevant to air navigation such as aircraft weight and balance data.

Data Service Provider

A Data Service Provider receives, assembles, translates, selects, formats, distributes or integrates Aeronautical Data and information that is released as an authoritative source for use in aeronautical databases on aircraft or in operational aviation systems, applications and equipment.

Declaration Of Compliance

A statement, signed by the Head of Design Organisation or by an authorised representative, to show compliance with all applicable type-certification basis and, where applicable, environmental protection requirements. It declares that the product is airworthy within the specific design limitations.

Decompression Illness (DCI) *

A term referring to a group of clinical conditions that may result from exposure to a change in ambient pressure.

Defect *

A fault, other than by fair wear and tear, which renders an item unsuitable for its intended use. The fault may be in design or deviation of a dimension, finish or other functional characteristic from specified requirements or from recognised standards of engineering practice.

Defence *

Civilian and Service elements of the Defence portfolio.

Defence Aircraft *

Aircraft operated by or on behalf of Defence (see also Military Aircraft).

Superseded

Defence Area (DA) *

An area intended to protect public safety by giving notice of a practice, prohibiting entry to, and allowing the removal of unauthorised people, vehicles, vessels or aircraft from a DA when an authorised Defence operation or practice is in progress. DA's may also be referred to as Defence training areas and ranges.

Defence Aviation *

The design, construction, maintenance and operation of any aircraft owned, leased, hired or chartered by Defence; any aircraft operated exclusively for or on behalf of Defence; any aircraft for which CASA has placed statutory airworthiness responsibilities on Defence.

Defence Aviation Authority (Defence AA) *

Appointment by the Secretary of Defence and the Chief of the Defence Force (SEC/CDF) to the Chief of Air Force (CAF) assigning accountability for the regulation and oversight of all aspects of Defence aviation.

Defence Aviation Authority Directive (DAAD) *

Directive issued by the Defence AA to promulgate immediate and binding requirements to authorise or restrict a course of action in relation to an Aviation System.

Defence Controlled Land * (UAS Context)

Land where Defence controls access by the General Public (GP), such that Defence can ensure, for example: UAS operations can be conducted which are not in the proximity of, or overhead, the GP.

Defence Employee *

A person employed in the Department of Defence under section 22 of the Public Service Act 1999.

Defence Long Range Operations (DLRO) *

Involves fixed-wing multi-engine turbine aircraft, operated by Defence, which may carry Defence personnel on long-range flights, as determined by the MAO.

Defence Member *

A person as defined in section 3 of the Defence Force Discipline Act 1982, means (1) a member of the Permanent Navy, the Regular Army or the Permanent Air Force; or (2) a member of the Reserves who is rendering continuous full-time service or is on duty or in uniform.

Superseded

Defence Organisation *

The Australian Defence Force and the Department of Defence.

Defence Personnel *

In the context of DASR applicability, Defence Personnel means all Defence Employees, Defence Members, ADF Cadets and ADF Cadet Staff and foreign equivalents while serving with Defence.

Defence Register *

The Defence aircraft register maintained by DASA.

Defence Registered Aircraft *

An aircraft listed on the Defence Register.

Delegate Of The Safety Authority (DoSA) *

An individual, external to the Defence Aviation Safety Authority, who has been formally assigned an Authority responsibility and is considered an agent of the Authority when exercising that delegation. The individual may be external to Defence.

Design Change

A change in type design (described in DASR 21.A.91 - Classification of change in type design).

Detect And Avoid *

The capability to see, sense or detect conflicting traffic or other hazards and take the appropriate action.

Developmental Test And Evaluation (DT&E) *

An engineering function used by the manufacturer, or a nominated test agency, to establish that a system complies with the design requirements.

Display Flying*

A subset of an Air Display whereby the flying activity is designed to demonstrate handling and operational capabilities, in the approved envelope for the Aircraft Type, using a display sequence flown by specifically qualified Crew.

Superseded

DLRO (Defence Long Range Operations) Area Of Operations *

The area of operations, over land or water, where an aircraft's diversion time is outside of the nominated threshold time.

DLRO Benign Environment *

For the purpose of DLRO, a benign operating environment is one where military aircraft operations are largely 'civil Regular Public Transport (RPT) like'. Therefore, flight profiles will typically involve take-off, climb to altitude, cruise / loiter at altitude and a decent / hold at the nominated destination. In addition, a benign operating environment is associated with numerous DLRO aerodromes / alternates, high reliability and availability of Communication, Navigation and Surveillance (CNS) and Air Traffic Management (ATM) services.

DLRO Challenging Environment *

For the purpose of DLRO, a challenging operating environment is one where military aircraft operations are potentially conducted in a contested environment and within complex airspace. Therefore, flight profiles will typically involve low level nap of earth flight, manoeuvring and defensive action. In addition, a challenging environment is associated with limited aerodromes / alternates and potentially reduced CNS and ATM services / facilities.

DLRO Maximum Diversion Time *

The maximum time an aircraft can fly from an adequate aerodrome, based on endurance afforded by the aircraft's most time limited system at the One Engine Inoperable (OEI) speed, in International Standard Atmosphere (ISA) still air conditions.

DLRO Significant Event *

For the purposes of DLRO, a significant event is where there is any system malfunction, degradation or other in-flight event, which requires the flight crew to make a decision to turn back, divert or continue at an increased level of alertness.

DLRO Significant System *

A propulsion system or any other aircraft system whose failure could adversely impact the safety of a DLRO flight, or whose function is required for continued safe flight and landing.

DLRO Threshold Time *

A 'threshold time' is the maximum flight time to an adequate aerodrome (at OEI, ISA still air conditions) before a DLRO approval is required.

Superseded

Dry Lease *

A Defence aircraft lease for an aircraft that does not include, maintenance or insurance requirements.

Dual Flight *

Flight conducted in an aircraft or accredited Flight Simulation Training Device while receiving training from a flying instructor.

Emergency Locator Transmitter (ELT) *

Equipment which broadcasts distinctive signals on designated frequencies and depending on application, may be automatically activated or be manually activated.

Engineering Authority (EA) *

The authority assigned expressly to an organisation or to an individual within an organisation to undertake specific engineering activities.

Explosive

A substance manufactured with a view to producing an explosion or pyrotechnic effect.

Exposition*

The document or documents that contain the material specifying the scope of work deemed to constitute sufficient evidence to justify organisational approval and showing how the organisation complies with a DASR.

Extension

Inclusion of additional topics to Category A, B1 and B2 Military Aircraft Maintenance Licences (MAML) as detailed in DASR 66 Appendix I (which includes Modules 55–55) that are not part of the applicable modules for that category of MAML.

External Lift*

The external carriage of air cargo by rotary wing aircraft.

External Service Providers *

Contractors, consultants and professional service providers engaged by Defence.

Superseded

Fatigue *

A physiological state of reduced mental or physical performance capability resulting from sleep loss or extended wakefulness, circadian phase, or workload (mental or physical activity) that can impair a member's alertness and ability to safely operate an asset or perform safety-related duties.

First Pilot *

The Aircraft Captain or a type rated pilot authorised as crew who is occupying a seat with access to flight controls and actually in control of the aircraft.

Fit For Flight

Condition of a type design being certified as compliant with applicable airworthiness requirements as well as of an aircraft having been serviced and inspected as meeting the certified design and prepared for the intended flight.

Flight *

a. In the case of a heavier-than-air Aircraft, the operation of the Aircraft from the moment at which the Aircraft first moves under its own power for the purpose of taking-off, until the moment at which it comes to rest after being airborne. (Note: DASA does not intend for the definition of Flight to affect the way in which environmental commanders define 'Flight Time'. Environmental commanders may define 'Flight Time', or delegate the definition of 'Flight Time' to FEG Commanders).

b. In the case of a lighter-than-air Aircraft, the operation of the Aircraft from the moment when it becomes detached from the surface of the earth, or from a fixed object on the surface of the earth, until the moment when it becomes again attached to the surface of the earth or a fixed object on the surface of the earth.

Flight Authorisation *

The process through which qualified and competent Crew are approved to conduct a particular Mission, including the application of limitations or controls.

Flight Crew *

Crew, including personnel authorised to undertake aircraft type qualification training, who are charged with duties essential to the safe operation of an aircraft, including remotely piloted aircraft. Flight crew is a subset of crew.

Flight Data Recorder (FDR) *

A device that use a combination of data providers to collect and record parameters that reflect the state and performance of an aircraft.

Superseded

Flight Information Documents (FID) *

A suite of documents that includes Flight Information Publications (FLIP) aeronautical maps, aeronautical charts and similar documents that support aviation activities.

Flight Information Publication (FLIP) *

An enduring term that describes various aeronautical information designed for use primarily in the cockpit environment.

Flight Information Service (FIS) *

An Air Traffic Services (ATS) subcategory provided for the purpose of giving advice and information useful for the safe and efficient conduct of flight.

Flight Planning *

The Aircraft Captain's planning for the safe conduct of the Flight, based on considerations of:

a. Aircraft performance

b. Mission considerations

c. expected conditions on the route to be followed, or in the area of operations and at the relevant aerodromes

d. navigation sources and facilities associated with the intended route and relevant aerodromes

e. the effects of normal, emergency and operating limitations on the above.

Flight Procedure Design Services (FPD Services)*

The design, documentation and validation of flight procedures including the ongoing review and maintenance of flight procedures.

Flight Recorder *

Any type of receiver installed in the aircraft for the purpose of complementing accident/incident investigation or flight analysis, this includes a Flight Data Recorder (FDR) and Cockpit Voice Recorder (CVR).

Flight Related Operations *

Flight Related Operations refer to those operations which, while not strictly meeting the definition of 'Flight', warrant consideration of the application of Flight Authorisation and related aviation Hazard controls. Such operations may include: high-speed aborts, engine running on-loads and off-loads, rotors-turning ground events on helicopters, engine ground runs (excluding ground runs conducted by maintenance personnel as a part of routine maintenance activities) and taxiing.

Superseded

Flight Simulation Training Device (FSTD) *

A device that simulates an aircraft or part of an aircraft used to train personnel who interact with aircraft flight controls or power plant controls to manoeuvre the aircraft in flight and/or on the ground, and needs approved standards for the purpose of permitting experience acquired therein to be credited towards meeting requirements for operator qualification, categorisation or currency.

Flight Simulator (FS) *

See Flight Simulation Training Device (FSTD).

Flight Test *

A type of flying activity conducted in support of broader Defence Test and Evaluation (T&E) requirements that has any of the following characteristics:

a. flight of a not yet certified design (aircraft, propulsion systems, parts or appliances);

b. flights to demonstrate compliance to certification basis or conformity to type design;

c. flights intended to experiment new design concepts, requiring unconventional manoeuvres or profiles for which it could be possible to exit the already approved envelope of the aircraft;

d. flight to evaluate a change in role or operating environment; or

e. training flights in support of the above activities.

Flight Test Pilot *

A pilot qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Test System Specialist *

A person qualified and authorised to carry out research, development, test or evaluation of Flight Test activities.

Flight Training Device (FTD) *

A Synthetic Training Device (STD) that simulates the aircraft in ground and flight operations to the extent of the systems installed in the device and comprises a full size replica of the instruments, equipment, panels and controls in an open flight deck area, or an enclosed flight deck of the aircraft, but does not, in every respect, simulate the aircraft in ground and flight operations. An FTD includes the necessary software and equipment, and the way that the equipment is interconnected.

Superseded

Flying Display *

A planned display of sequence(s) by one or more aircraft for an assembled group of people that may include demonstrations of handling and operational capabilities within the approved envelope for the type.

Flying Instructor *

A pilot who is qualified and authorised to deliver pilot type qualification training in the airborne or simulated airborne environment.

Flying Management System (FMS) *

A system of processes and procedures within a flying organisation centred on Aircraft types which establishes the management practices, operational rules, and operator training and qualification requirements that support safe Flight Operations.

Flying Supervision *

The function of oversight and management of Crew in aviation operations, considering both safety and Mission, to ensure the safety of Defence aviation through adherence to Flying Management System controls. Flying Supervision is more than Flight Authorisation and monitoring of any single Flight. Supervision is a holistic task that requires:

a. overseeing training, qualification and development of Crew

b. the assignment of a suitable Crew to a task or Mission

c. supervising the Mission planning and Flight Planning, Mission execution and post-Mission reporting and recording

d. Flight Authorisation, where the Flying Supervisor is a qualified and authorised Flight Authorisation Officer.

Flypast *

A subset of an Air Display whereby a Flight of one or more Aircraft is tasked to pass over a specific location on a constant track and at a constant height at a specified time.

Foreign Military Aircraft *

A military aircraft of any foreign nation, certified for flight under that nation's Military Aviation Authority.

Superseded

Foreign Object Debris (FOD) *

A substance, debris or article alien to a vehicle or system that has potential to cause damage to aircraft. Examples of FOD are aircraft parts, rocks, broken pavement, ramp equipment, and vehicle parts.

Foreign Register *

A civil aircraft register or military aircraft register maintained by any country other than Australia.

General (Standard) Cargo

Cargo without special, hazardous or dangerous properties and therefore does not require extra precautions or special handling for air transport.

General Public (GP) * (UAS Context)

All persons not classed as Mission Essential Personnel (MEP), including all persons not directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: GP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel.

Ground Support Equipment (GSE) *

The ancillary maintenance equipment necessary to maintain an aircraft during servicing.

Guidance Material (GM) *

This is typically developed to provide additional explanation to assist the application of the requirement and/or explain the Acceptable Means of Compliance (AMC).

Hazard *

A source of potential harm or a situation with a potential to cause loss.

Hazard Log *

A data base of identified hazards. It is a formal record of all data and tasks associated with identifying and resolving hazards.

Hazard Tracking Authority (HTA) *

An appointment or appointments – made by the appropriate Force Element Group (FEG) commanders or Navy and Army equivalents - responsible for tracking actions and recommendations from FEG aviation safety reports to completion.

Superseded

Height Above Obstacles Within (HAOW) *

The vertical distance between an aircraft and the highest obstacle on the terrain or water surface within a specified lateral radius from the aircraft's position. For example, '500ft HAOW 600m' means 500 feet of vertical separation between the aircraft and the highest obstacle within 600 metres of that aircraft.

Helicopter

A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more normally power-driven rotors on substantially vertical axes.

Helicopter Landing Site (HLS) *

A defined area that may be used by helicopters for the purposes of landing or taking off, including infrequent, opportunity and short term basis for all types of operations. It may or may not be located on an Aerodrome. It may also be referred to as a helipad.

Helipad *

See Helicopter Landing Site.

Heliport *

An Aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors

Principles which apply to design, certification, production, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration of human performance.

Human Performance

Human capabilities and limitations which have an impact on the safety and efficiency of operations.

Hypoxia *

A lack of oxygen to the tissues sufficient to cause impairment of function.

Implement

To introduce requirements into regulations (DASR) by either adoption or compliance.

Superseded

Implementing Regulation

Regulation that amplifies the operation of Basic Regulation, within the defined constraints as provided within the Basic Regulation.

Includes (Rules Of Interpretation) *

'Includes' means: 'includes but is not limited to'.

Independent *

In the context of, or similar to, 'independent board' or 'independent inspection' and within these Regulations means independent of the chain of command which is being assessed or inspected.

Inshore *

Flight over water below LSALT within 20 nm of land, including reefs and rocks, or fixed obstacles, which include manufactured obstacles such as oil rigs that are continually above the high water mark.

Inspection *

The process of determining compliance with engineering standards and applicable maintenance documents.

Instructions For Continuing Airworthiness (ICA)

Instructions for Continuing Airworthiness (ICA) detail the methods, inspections, processes, and procedures necessary to keep aircraft and/or products airworthy.

Instrument Rating *

An award that indicates a pilot has attained a high level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC.

Instrument Rating Examiner (IRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Tests.

Key Staff *

Appointments within a DASA approved organisation that contribute to the safe operation of an aviation system.

Superseded

Life Limited Parts

Parts that, as a condition of their type-certificate, may not exceed a specified operating time, calendar time, number of operating cycles, or any other approved service life consumption units.

Limitations *

Lack of capacity; inability to achieve required outputs; restrictive weakness; physical or environmental constraint; an action imposed by an authority, eg an AwB or Defence AA constraint, which must be undertaken, ie you MUST DO something.

Limited Certification Authorisation

This is issued by the AMO, in accordance with a procedure approved by the NMAA, for flight crew, flight engineer or crew chief to carry out specific tasks (usually away from their home base or station). The authorisation permits the holder to issue certificates of release to service following specific tasks within the limits of the tasks specifically endorsed on the authorisation.

Line Maintenance

Carried out before flight to ensure that the aircraft is fit for the intended flight.

Long Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for more than a year, to support ongoing Defence activity.

Lost Link * (UAS Context)

The loss of command and control link contact with a remotely-piloted aircraft during its operation.

Low Flying *

As defined in Flight Information Handbook Australia (FIHA) and consistent with the relevant OpSpec.

Low Flying Area (LFA) *

A surveyed area that is approved for use and unlimited aircraft manoeuvring within the LFA boundaries to an authorised height.

Low Flying Route (LFR) *

A surveyed route that is approved for use and assures obstacle and terrain clearance will exist within the LFR boundaries to an authorised height.

Superseded

Lowest Safe Altitude (LSALT)

The lowest altitude which will provide safe terrain clearance at a given place.

Maintenance

Any one or combination of overhaul, repair, inspection, replacement, modification or defect/fault rectification of an aircraft or component, with the exception of pre-flight inspection.

Maintenance Check Flight *

Flying activity conducted after aircraft maintenance when required by Instructions for Continuing Airworthiness (ICA). However, ICA may use different terminology. Note, there may be other check flights conducted in service that are not required by ICA; these flights are not a regulatory requirement. Maintenance check flight is not to be confused with flight test which is covered under DASR 21. (Refer to glossary entry for `Unit Maintenance Test Pilot'.)

Maintenance Manual

That part of the Military Air System document set which identifies the particular maintenance procedures and periodicity necessary to maintain the airworthiness of the Military Air System.

Master Minimum Equipment List (MMEL)

A list established for a particular aircraft type by the organisation responsible for the Type Design with approval of DASA. The MMEL identifies items which individually may be unserviceable at the commencement of flight. The MMEL may be associated with special operating conditions, limitations or procedures.

May * (Rules Of Interpretation)

'May' is used in the permissive sense to state authority or permission to do the act prescribed, and the words 'no person may' or 'a person may not' mean that no person is required, authorised or permitted to do the act described.

Means Of Compliance

The techniques that will be used to demonstrate the compliance of the type design against each certification requirement identified in the Certification Basis. Examples include test, analysis and inspection.

Mechanic *

Mechanics carry out maintenance tasks to standards specified in the maintenance data and should notify supervisors of defects or mistakes requiring rectification to re-establish required maintenance standards.

Superseded

Meteorology (MET) *

A service that provides area and terminal weather information services that safely support aviation activities, such as flight planning and enroute diversion decisions based upon changing weather conditions.

Meteorological Services

A service that provides weather information services to support the safety, regularity and efficiency of aviation activities.

Military Air Operator (MAO) *

The regulated organisation approved by the Defence Aviation Authority to perform military air operations as defined in the issued Military Air Operator Certificate (MAOC) and in accordance with DASR. In Defence, a MAO is usually a Force Element Group (FEG) or equivalent.

Military Air Operator Certificate (MAOC) *

Certificate (DASR Form 138) issued by the Defence AA to authorise the Military Air Operator (MAO), usually a Force Element Group (FEG) or equivalent, to perform military air operations as defined in the accompanying Operations Specification (OpSpec) and in accordance with DASR.

Military Aircraft *

An Aircraft, (including Uncrewed Aircraft System (UAS)), designed and/or operated for military use and/or registered or intended to be registered on the military register of a Military Airworthiness Authority (MAA).

Military Aircraft Maintenance Licence (MAML)

A categorised licence which, dependent upon completion of all relevant approved training and examinations, and the requisite levels of practical experience, permits an authorised individual to issue certificates of release to service (CRS) or act as support staff for scheduled and / or unscheduled maintenance performed on an aircraft or aircraft systems as defined by DASR 66.

Military Airworthiness Authority (MAA) *

See Military Aviation Authority

Military Aviation Authority*

A person or organisation responsible for the safety oversight of military aviation. An MAA acts independently from the operational, acquisition and sustainment chains of command and is assigned responsibility through a formal instrument such as legislation or an order, directive or decree.

Superseded

Military Certification Review Item (MCRI) *

A document recording Deviations, Special Conditions, new Means of Compliance or any other certification issue which requires clarification and interpretation, or represents a major technical or administrative issue.

Military Permit To Fly (MPTF) *

Permit issued by the Authority or organisations granted such privilege by the Authority when an aircraft does not meet, or has not been shown to meet, applicable airworthiness requirements but is capable of safe flight under defined conditions and for specified purposes. A Military Permit to Fly (MPTF) is also issued for Flight Test activities.

Military Restricted Type Certificate (MRTC) *

Certificate issued by the Authority for a product that does not comply with the applicable Type Certification Basis with restrictions imposed in regard to the intended use of the product.

Military Supplemental Type Certificate (MSTC) *

Certificate issued by the Authority that certifies a MAJOR change to a product's type design.

Military Type Certificate (MTC) *

Certificate issued by DASA stating that a product complies with the applicable airworthiness requirements.

Military Type Certificate (MTC) Holder

The organisation responsible for the relevant Type Design accepting the rights and obligations for the product.

Minimum Equipment List (MEL)

A document that allows for the operation of a specific aircraft under specific conditions with particular item(s) of equipment inoperative at the time of dispatch for the intended flight. Despite the inoperative equipment, the aircraft still complies the Master Minimum Equipment List. (CASA CAAP 37-1(5) - Minimum Equipment Lists).

Minimum Sector Altitude (MSA)

The lowest altitude which may be used which will provide a minimum clearance of 1,000FT above all objects located in an area contained within a circle or a sector of a circle of 25NM or 10NM radius centred on a significant point, the ARP or the HRP.

Superseded

Minimum Separation Distance* (MSD)

The authorised minimum separation, in all directions, between any part of an Aircraft in Flight and the ground, water or Obstacle. MSD applies when flying at less than 2,000 feet above the surface, and does not apply during take-off or landing or to the separation between Aircraft in the same formation.

Minor Amendment

Those changes to the organisation's Exposition(s) which do not affect the DASR related approvals.

Mission *

The assignment of one or more Aircraft to complete a specific task, which may involve multiple Flights.

Minor Maintenance

Includes repetitive tasks and simple defect/fault rectification.

Mission Crew *

Crew who may or may not be qualified on aircraft type, but their qualifications are essential for the successful outcome of a specific aviation mission. Mission crew is a subset of crew.

Mission Essential *

Personnel, equipment or cargo required to successfully conduct a specific aviation mission.

Mission Essential Passenger *

A passenger whose carriage aboard an aircraft is directly associated with the specific mission being conducted. A mission essential passenger may include a boarding party, medical patient, paratroops, troops, deploying personnel or survivors from a Search and Rescue task.

Mission Essential Personnel (MEP) * (UAS Context)

All persons directly associated with the operation of the UAS or briefed as part of the UAS mission.

NOTE: MEP includes all persons directly associated with the operation of the UAS or briefed as part of the UAS mission. MEP is a broader class than personnel directly associated with the launch, recovery and control during flight of the UAS. MEP may, depending on the UAS mission, include civilians, Defence personnel, and/or foreign military personnel. MEP must be aware of the UAS operations, the associated hazards and be essential to the conduct of the UAS task. MEP may include ground troops within a Defence joint operation/exercise area, troops on a Defence ship or civilian personnel operating as part of a counter terrorism tasking.

Superseded

Mission Instructor *

A non-pilot crew member who is qualified and authorised to deliver instruction in the airborne environment or simulated airborne environment.

Model *

An aircraft or system model is a derivative of an aircraft or system type that follows a unique lineage. For example, an A-47 Poseidon is an aircraft type, whilst P-8A is the aircraft model.

Modification

A modification is a change of design to the authorised configuration of the approved type design of product, part or appliance.

Typical examples are component changes, equipment additions, or software changes and often involve a revision to the drawings and support documentation.

Multi-Crew *

The crewing of an aircraft by more than one crew member.

Must (Rules Of Interpretation) *

'Must' is used in the imperative sense. Use of other commonly used imperatives, such as 'shall', 'is to', or 'will' should not occur.

National Airworthiness Authority (NAA) *

See Civil Aviation Authority

National Military Airworthiness Authority (NMAA) *

See Military Aviation Authority (MAA).

Negative Training *

Techniques learned or practiced in the Flight Simulation Training Device (FSTD) which do not translate to correct actions during a safety-critical activity in the airborne environment as a result of incorrect training, fidelity or fit out of the FSTD.

Night Vision Device (NVD)

Any electro-optical device that is used to detect visible and infrared energy and provide a visible image.

Superseded

Night Vision Goggles (NVG)

An electro-optical image intensifying device that detects visible and near-infrared energy, intensifies the energy, and provides a visible image for night viewing.

NOTES:

1. Night vision goggles can be either hand-held or helmet-mounted.

2. Plural form (Night Vision Goggles) refers to binocular equipment and the singular form (Night Vision Goggle) refers to monocular equipment.

Night Vision Imaging System (NVIS)*

A system in which all of the elements required to operate an Aircraft successfully and safely using NVDs are integrated, including NVDs, NVIS compatible lighting, Aircraft components and equipment, training and currency, operating procedures and Continuing Airworthiness.

Non Compliance *

The failure of a plan or procedure to comply with requirements.

Non Conformance *

The failure of a product, process or system to meet its regulatory, specification, drawing, or quality requirements.

Non-Certified Aerodrome *

An aerodrome in respect of which an aerodrome certificate has not been issued.

Non-Defence Registered Aircraft *

An aircraft operated by or on behalf of Defence that is not recorded on the Defence Register.

Non-Standard Cargo*

Non-Standard Cargo is cargo that requires special handling, additional precautions or specific procedures developed for either its preparation, composition, configuration, loading, placement, restraint or unloading. Non-standard cargo includes Dangerous Goods, security- protected consignments, service weapons, safe hand, human remains, unaccompanied personal effects, live animals, mail, perishables, and unserviceable or crashed Aircraft. Non-Standard Cargo also includes the following, where special handling, additional precautions or specific procedures are required:

(a) cargo that is not contained in a unit load device or pallet certified for the aircraft cargo loading system

(b) cargo requiring attachment directly to the aircraft floor.

Superseded

Non-Technical Skills (NTS) *

Those human performance skills that promote reliable and effective task performance in complex work systems. NTS encompass attributes such as the ability to recognise and manage human performance limitations, make sound decisions, communicate effectively, lead and work as a team and maintain situation awareness.

Note: (Independent Board Of Review) *

A review finding which identifies a significant aviation safety issue that is being addressed through management action.

Observation (Independent Board Of Review) *

A review finding which is worthy of comment, but does not require additional management action.

Obstacle *

Is all fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft; or extend above a defined surface intended to protect aircraft in flight; or stand outside those defined surfaces and that have been assessed as being a hazard to air navigation.

Occurrence Reporting *

The reporting of any failure, malfunction, defect, act, omission or other occurrence which has resulted in or may result in an unsafe condition. The objective of occurrence reporting is to use the reported information to contribute to accident prevention and the improvement of aviation safety. Further detailed information regarding occurrence reporting including reportable incidents, timeframes and occurrence reporting types is contained in AMC GR.40 - Occurrence Reporting.

Offshore *

Flight over water other than ‘inshore’.

Operation (of the Aircraft) *

The process and action of operating aircraft (following the initial and continual acceptance of the design, construction and maintenance processes, acts and actions) by the operational chain of command in relation to the Flight of such Aircraft in the operational environment.

Operational Effectiveness *

The ability of a system to perform its intended function over its intended operational spectrum, in the expected operational environment, and in the face of expected threats when operated by typical operational Defence personnel.

Superseded

Operational Servicings (B/F, T/A, A/F) *

Operational Servicings are any maintenance conducted before or after flight as defined in the Aircraft Maintenance Program (AMP). The AMP may include pre-flight inspection tasks outlined in DASR AMC M.A.301(a)(1).

Operational Suitability *

The capacity of the system, when operated and maintained by typical operational Defence personnel in expected numbers, at the expected level of competency, to be reliable, maintainable, available, logistically supportable, compatible, interoperable, safe and is ergonomically satisfactory.

Operations Specification (OpSpec) *

An integral component of the Military Air Operator Certificate (MAOC), Air Cargo Delivery Service Provider Certificate (ACDSPC) and Air Battle Management Operator Certificate (ABMOC), but prepared on a separate form (DASR Form 139) and details key positions of the MAO, ACDSP and ABMO, aircraft types or operations authorised, and operating provisions. Roles and tasks, specific approvals and any limitations/conditions (where necessary) for each approved aircraft type or operation are detailed in separate annexes.

Opposition Manoeuvre *

A manoeuvre where flight vectors of aircraft are opposing each other in close proximity.

Orders, Instructions And Publications (OIP) *

A suite of advisory, informative, procedural, directing and mandating documents that support the operations of an aviation system. OIP may include: aircrew manuals specific to type; general aircrew publications; Defence Instructions; Standing Instructions; command and unit issued Flying Orders, Special Flying Instructions and standard operating procedures.

Original Equipment Manufacturer (OEM) *

A manufacturer listed as the approved source of manufacture for components in the Type Certificate data sheet. The OEM owns and controls the source drawings, i.e. the design of the component.

Passenger *

Any person who is on board an aircraft other than a member of the authorised crew.

Perform Maintenance / Task Sign-Off *

Task sign-off attests that a competent and authorised person has performed the maintenance task prior to certification.

Superseded

Performance Based Navigation (PBN)

Area navigation based on performance requirements for aircraft operating along an Air Traffic Services (ATS) route, on an instrument approach procedure or in a designated airspace.

Note: Performance requirements are expressed in navigation specifications (ie RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Periodic Health Examination (PHE) *

A more comprehensive assessment that periodically replaces the Specialist Employment Stream Annual Health Assessment (SESAHA) in accordance with Defence policy. Also considered an aviation medical certificate assessment when conducted by an AVMO.

Pilot *

A person qualified and authorised to manipulate the flight controls of an aircraft during flight.

Populous Area * (UAS Operations Context)

An area in relation to the operation of a UA that has a sufficient density of population for some aspect of the operation, or some event that might happen during the operation (in particular, a fault in, or failure of, the UA) to pose an unreasonable risk to the life or safety of somebody who is in the area, but is not connected with the operation.

Portable Electronic Equipment (PEE) *

Comprises all electrically powered equipment that is carried on Defence aircraft by crew and passengers, not forming part of the certified aircraft type, Role Equipment, ALSE or cargo.

Pre-Flight Inspection *

The pre-flight inspection is a continuing airworthiness task intended to encompass all of the actions necessary to ensure that the aircraft is fit to make the intended flight. The pre-flight inspection is not maintenance and can be carried out by appropriately trained maintenance, aircrew or other personnel in accordance with published guidance from the operating organisation.

Preventive Maintenance *

Those actions that reduce the probability of a known failure mode in items with predictable wear-out characteristics by retaining materiel and restoring it to a specified condition.

Primary Runway *

The runway used most frequently or that provides the best overall aerodrome capability.

Superseded

Privilege *

The means by which the holder of a qualification, rating, endorsement or approval is authorised to conduct an activity.

Production *

The manufacture and assembly of new parts, appliances, aircraft, engines or propellers to approved design data.

Products, Parts And Appliances

Product = the design of an aircraft, engine or propeller (each can be granted with a Type-certificate).

Parts and appliances = lower level components for which an AUSMTSO (or foreign TSO) may exist, and fitted to a product.

Qualification * (Flight Simulation Training Device Context)

The verification and validation of the functionality and fidelity of a Flight Simulation Training Device (FSTD) against an accepted standard. The end result of a process which formally examines and documents compliance of a FSTD, against predefined standards, to the satisfaction of the relevant qualification organisation approved by the Authority.

Qualified Entity *

A body (Commonwealth or commercial) which may be allocated a specific certification task by, and under the control and responsibility of, the Authority.

Quality Management System (QMS) *

All activities of the overall management function that determine the quality policy, objectives and responsibilities and implement them by means such as quality planning, quality controls, quality assurance and quality improvement.

RAAF Institute Of Aviation Medicine (IAM) *

The ADF Centre of Excellence for aviation medicine related issues.

Ramp Inspection *

Related to the operation of Civil Registered Aircraft chartered for temporary use by Defence. The Ramp Inspection is an acknowledged means of providing confidence in a charter aircraft's fitness for purpose and assessing the suitability of a charter supplier.

Superseded

Recency *

A prescribed period of on-going practical application of a function, set within a prescribed currency period that ensures a qualification or skill remains proficient throughout the currency period.

Reduced Vertical Separation Minima (RVSM)

Reduced vertical separation minimum of 300 m (1000 ft) between FL 290 and FL 410 inclusive.

Registration

Registration is the formal recording by the NMAA of an individual aircraft on the military aircraft register and the assignment of a tail number.

Regression Testing*

A test process re-running functional and non-functional tests to ensure that previously developed and tested software still performs as expected after a change. Regression Testing also includes testing software not amended during the latest upgrade to ensure the software change has not affected interface control data.

Remote Pilot (RP) * (UAS Context)

The person in direct command/ control of the UAS, including manipulating flight controls or programming waypoints during flight.

Remote Pilot Station (RPS) * (UAS Context)

A station at which the RP manages the flight of a UA.

Remotely Piloted Aircraft (RPA) * (UAS Context)

An uncrewed aircraft that is operated by a remote pilot or air vehicle operator.

Remotely Piloted Aircraft (RPA) Observer * (UAS Context)

A trained and competent person designated by the operator who, by visual observation of the remotely piloted aircraft, assists the remote pilot in the safe conduct of the flight.

Remotely Piloted Aircraft System (RPAS) * (UAS Context)

A subset of Uncrewed Aircraft Systems (UAS), a RPAS is a system consisting of the remotely piloted aircraft (RPA), together with any Remote Pilot Station (RPS), communications/data links, maintenance, launch and recovery systems. This includes the network and operating personnel required to control the RPAS. A RPAS may also be referred to as a UAS.

Superseded

Repair

A 'repair' means the elimination of damage and/or restoration to an airworthy condition following initial release into service by the manufacturer of any product, part or appliance.

Required Navigation Performance (RNP)

A statement of the navigation performance necessary for operation within a defined airspace.

Note: Navigation performance and requirements are defined for a particular RNP type or application.

Rest Period *

A continuous uninterrupted and defined period of time, following duty or prior to duty, during which a person is free of all duties, standby and reserve.

Restricted Instrument Rating *

An award that indicates a pilot has attained a level of specialist instrument flying skills required for the safe and effective operation of the specified aircraft type in IMC, but has not met the full criteria to be awarded an Instrument Rating.

Restricted Type-Certificate Data Sheet (RTCDS)

Companion document to Military Restricted Type-Certificate (MRTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the RTCDS.

Restrictions *

Prohibitions on activities that an authority might impose (i.e. you MUST NOT DO something). Such imposed conditions are designed to treat limitations.

Risk Management (RM) *

The application of Risk Management in the context of Defence aviation operations. RM offers a systematic, logical approach to identifying and treating risks to Defence aviation resources and missions, while supporting initiative, flexibility and adaptability

Risk Mitigation *

The strategy and methods employed to eliminate or minimise risks presented by a hazard.

Superseded

Role Equipment *

Any equipment, apart from ALSE, fitted to an aircraft on a non-permanent basis, or carried on board, for operation by crew or passengers in flight to support a Defence role or mission.

Runway Incursion *

Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Safety Critical

Applied to a condition, event, operation, process, or item whose proper recognition, control, performance, or tolerance is essential for safe system operation or use; eg safety critical function, safety critical path, safety critical component.

Safety Critical Area *

A working environment assessed as having a heightened risk to the physical safety of personnel, or where key operational decisions are made. For example an aircraft flight deck or an ATC Control Tower.

Safety Management System (SMS) *

See Aviation Safety Management System (ASMS).

Segregated Airspace (SA) * (UAS Context)

Airspace of specified dimensions allocated for exclusive use to a specific user(s).

Segregation *

Airspace Control Measures (ACM) that ensure that two or more aircraft do not come into such close proximity that a threat to the safety of those aircraft exists.

Senior Air Traffic Control Officer (SATCO) *

An internationally recognised civil/military term describing the person commanding and/or managing the ATC unit responsible for the ATS delivery at a specific aerodrome and the airspace relevant to the aerodrome. At Defence aerodromes, the SATCO may also hold an administrative command title appropriate to the ATS unit concerned.

Senior Instrument Rating Examiner (SIRE) *

A pilot who is qualified and authorised to conduct Instrument Rating Examiner assessments.

Superseded

Sensor Operator *

A person charged to operate airborne sensor systems on a crewed aircraft or UAS to collect, analyse and distribute airborne sensor data.

Separation Assurance *

The assurance provided by the Air Traffic Control (ATC) service provider that if the pilot complies with ATC control instructions an aircraft will maintain a prescribed minimum separation standard from another aircraft or object.

Serious Injury Or Illness *

An injury or illness requiring the person to have:

a. immediate treatment as an in-patient in a hospital, or

b. immediate treatment for:

1. the amputation of any part of their body
2. a serious head injury
3. a serious eye injury
4. a serious burn
5. the separation of their skin from underlying tissue (such as degloving or scalping)
6. a spinal injury
7. the loss of a bodily function
8. a serious laceration.

c. medical treatment within 48 hours of exposure to a substance. (WHS Act 2011)

Service Life-Limit For Components *

Specified life-limit after which the components should undergo maintenance to restore their serviceability.

Service Provision Conditions (SPC)*

An integral component of the Air Navigation Service Provider Certificate (ANSPC) that details:

(a) key positions

(b) the types of service the ANSP Air Navigation Service Provider (ANSP) is certified to provide

(c) operating provisions.

Superseded

The complexity of the service(s) may be further detailed in separate annexes. For example, ATM services may have a separate annex for each Defence site where services are provided.

Shall (Rules Of Interpretation)

'Shall' is used in the mandatory requirement, as is 'must'.

Shipborne Heliport *

A defined area on a ship (including any installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of helicopters.

Short Term Lease *

The dry or wet leasing, renting or hiring of an aircraft by Defence, usually for less than one year, to support specialised Defence activity.

Should * (Rules Of Interpretation)

'Should' is used to imply an act or process identified for inclusion in a desired outcome is complied with unless sound reasoning may determine otherwise.

Side Number *

A unique RAN number that differs from the 'tail number' and is applicable to RAN aircraft only. The side number is normally the identifier used in call signs and for flight planning purposes. The side number is not normally included in the Defence Register.

Simulator Instructor *

A crew member who is qualified and authorised to deliver instruction in a simulated airborne environment.

Single Pilot *

The crewing of an aircraft by one pilot, even though other pilot positions may be available and occupied by non-pilot crew members.

Single Service Aviation Medical Advisor (SSAMA) *

An Aviation Medical Officer (AVMO) who represents a single Service, is recognised by the Surgeon General–ADF as being qualified to provide authoritative aviation medical advice and is responsible for the implementation of aviation medicine policies.

Superseded

Solo Flight *

Flight in which the pilot is the sole occupant of the aircraft.

Sparsely Populated Area *

An area considered outside the areas of cities, towns or settlements characterised by rangeland grazing, desert, uncultivated landscapes, wilderness, infrequent homesteads, large land holdings, extensive uncleared land, salt lakes, adjacent coastal waters and open ocean or navigable tracts of water with infrequent water traffic.

Special Conditions

Are introduced when the design features of a particular product or the experience in operation render any of the airworthiness code provisions inadequate or inappropriate to ensure conformity with essential requirements.

Specialised Services *

Services that include, but are not limited to, structural repair, composite repair, surface finishing, metal machining, metal spraying, shot peening, welding, electroplating and anodising, non-destructive testing, borescope inspections, in-flight entertainment systems.

Specialised Services Staff *

Staff who carry out specialised maintenance tasks to the standard specified in the maintenance data or defined standards acceptable to the NMAA.

Specialist Employment Stream Health Assessment (SESHA) *

A generic term that may be used to describe an aviation medical certificate assessment.

Sponsor *

The entity/organisation responsible for defining the required aviation outcome, receives or uses the outcome and is responsible for funding the related activities, processes, project or products required to safely achieve the outcome.

Standard *

A description of a material, product, doctrine or process meant for repeated applications by many users. A Technical Standard is an established norm or requirement. It is usually a formal document that establishes uniform engineering or technical criteria, methods, processes and practices.

Superseded

Standard Part

A Standard part is a part designated as such by the design approval holder responsible for the product, part or appliance, in which it is intended to be used and manufactured in complete compliance with an established specification which includes design, manufacturing, test and acceptance criteria, and uniform identification requirements. Examples of standard parts are aircraft general spares as defined by the design approval holder, such as nuts, bolts, washers, split pins, etc. All design, manufacturing, inspection data and marking requirements necessary to demonstrate conformity of the part will be in the public domain and published or established as part of recognised specifications.

Standard Scenario * (UAS Context)

A description of a UAS operation in the Specific category, for which risk controls have been determined based on a risk assessment, and introduced by the Authority.

State Aircraft * (Australian Context)

Aircraft of any part of the Defence Force (including any aircraft that is commanded by a member of that Force in the course of duties as such a member); and aircraft used in the military, customs or police services of a foreign country: Civil Aviation Act 1988, section 3; Air Navigation Act 1920, section 3.

Statement Of Operating Intent And Usage (SOIU) *

A document describing the approved roles, operating envelope, usage spectrum and operating environment for a particular aircraft type. The SOIU differentiates between tasks for which the type has been certified and tasks that are planned but will require certification action before flight can be authorised.

Stores Suspension Equipment *

All aircraft devices such as racks, adaptors, missile launchers, internal guns, countermeasure dispensers and pylons, used for carriage, employment and jettison of aircraft stores. Aircraft guns and countermeasure dispensers for flares and chaff must be considered to be stores suspension equipment.

Sub-Atmospheric DCI *

The term used to describe cases of decompression illness (DCI) induced by exposure to pressures less than sea level equivalent, such as encountered during flight. DCI is a potentially lethal condition and should be treated as a medical emergency. The term is referred to simply as DCI in DASR.

Supervisor *

Personnel who ensure that all required maintenance tasks are carried out and, where not completed or where it is evident that a particular maintenance task cannot be carried out to the approved

Superseded

maintenance data, then such problems should be reported to the DASR 145.A.30(c) person for appropriate action.

Supplemental Oxygen *

Refers to acceptable aviators' breathing oxygen that is available for use whenever required.

Support Staff

Those personnel holding a DASR 66 Military Aircraft Maintenance Licence in Category B1 and/or B2 with the appropriate privileges, certification authorisations and Military Aircraft Type Ratings, working in a base maintenance environment while not necessarily holding certification privileges.

Support Staff support the Category C licence holder and are required to ensure that all relevant maintenance tasks have been carried out to the required standard.

Surveyed Route Or Area *

A route or area is considered surveyed when it is flown in VMC by day and all hazards and obstacle data that may compromise Aviation Safety have has been identified and recorded.

Survivable Crash Or Accident *

An accident where the cockpit and/or structure remained relatively intact and the forces experienced by the occupants did not exceed, or should not have exceeded, the survivable limits of human G-tolerance.

Symmetry Check

A symmetry check is equivalent to a mensuration check or alignment check which is typically covered in the applicable Aircraft Maintenance Programme (AMP).

Synthetic Training Device (STD) *

Means:

a. a flight simulator

b. a flight training device

c. a basic instrument flight trainer

d. an air traffic control simulator; or

e. an air traffic control part-task trainer.

Superseded

System Safety *

The application of engineering management principles, criteria and techniques to optimise the safety of a 'system', within the constraints of operational effectiveness, time and cost throughout all phases of the life cycle.

System Safety Engineering *

An engineering discipline requiring specialised professional knowledge and skills in applying scientific and engineering principles, criteria, and techniques to identify and eliminate hazards, in order to reduce the associated risk.

System Tolerance *

The inherent ability of the Aviation System to compensate for inadequate/absent defences.

Tail Number *

The tail number is the unique numerical identifier, which is appended to the Application Identifier (AI), and identifies each individual aircraft. For example, A41–nnn for C–17 Globemaster, N48–nnn for MH–60R Seahawk.

Task Authorisation *

The legal authority allowing a person to perform a specified maintenance task, recognising that the person has completed the prerequisite training relevant to the task and has demonstrated competency in performance of the task. Task authorisations are recorded in the persons Navy 'A' card, AATTR or RAAFRTE or equivalent document.

Task 'Sign-Off' *

This is a statement, signed by an appropriately authorised and competent person or an appropriately authorised and competent MAML holder, that, the maintenance task has been completed, to the standard required, in accordance with the AMD.

Temporarily Medically Unfit For Flying (TMUFF) *

Where an aircrew member, remote pilot or aircraft controller is temporarily medically unfit to perform specialist flying related duties, but may perform non-flying related duties.

Test And Evaluation (T&E) *

T&E is a process to obtain information to support the objective assessment of a Capability System with known confidence, and to confirm whether or not a risk is contained within acceptable boundaries across all facets of a system's life cycle. The individual terms are defined as: a test is an activity in which a scientific method is used to obtain quantitative or qualitative data relating to the

Superseded

safety, performance, functionality, contractual compliance, and supportability of a system; and evaluation is analysis of test results to determine (verify) or prove (validate) something.

The Authority *

The Authority collectively refers to the Defence Aviation Authority (Defence AA), and specific appointments within the Defence Aviation Safety Authority (DASA) who have been given a delegation from the Defence AA to exercise authority on their behalf.

Time Limited System*

An aircraft system which when operated / activated, has a useful or safe operating time that is less than the maximum endurance of the aircraft. An example is a cargo bay fire suppression system.

Time Zone *

A time zone is one of the areas into which the world is divided according to what time it is there.

Two Pilot *

The crewing of an aircraft by two pilots in aircraft fitted with dual flying controls

Training Product

A qualification, skill, knowledge, competency, course or module that influences a basic training course (IAW DASR 66 syllabus), or aircraft type/task training course (IAW DASR 66).

Type *

A specific design (make and model) of a product certified under a single Type Certificate.

Type Certificate Data Sheet (TCDS) *

Companion document to a Military Type Certificate (MTC) and describes the basis of certification, lists any associated Military Certification Review Items (MCRIs), details technical characteristics and operating limitations, and includes details of each aircraft added to the TCDS.

Type Certification *

The process through which compliance of the design with the Type Certification Basis is established within the bounds of the intended operating roles and environment contained in the Statement of Operating Intent and Usage (SOIU).

Superseded

Type Certification Basis

An agreed set of airworthiness requirements (including code, special condition, etc) that a product must be compliant with in order to obtain a Military Type Certificate.

Type Design

The set of approved design information necessary to define the product type, as detailed in DASR 21.A.31 - Type design.

Type Rated *

Crew that are qualified to operate a particular aircraft type, or ground crew that are qualified to maintain a particular aircraft type.

Type Specific *

A qualification or endorsement is type specific if the qualification or endorsement applies only to an aircraft type that is specified on the qualification or endorsement.

UAS Flight Termination System * (UAS Context)

A control system that can immediately terminate flight of an uncrewed aircraft (UA) safely.

UAS Operating Permit (UASOP) * (UAS Context)

Approval to operate a UAS that is not Certified. Issued by the Authority, based on a risk assessment and the implementation of related risk controls.

UAS Operator * (UAS Context)

The organisation, eg MAO; or person with Operational Control (OPCON) or tasking authorisation for the UAS.

Unapproved Aeronautical Product *

Any part, component or material that has not been manufactured and certified as conforming to the technical data against which type certification is provided.

Underwater Locating Device (ULD) *

A device to allow the flight recorder to be located underwater post-crash.

Superseded

Uncrewed Aircraft (UA) * (UAS Context)

An air vehicle that flies under RP control or autonomous programming without a human on board in control.

Uncrewed Aircraft System (UAS) * (UAS Context)

The entire system consisting of the uncrewed aircraft (UA), Remote Pilot Station (RPS), communications/data links, networks, launch and recovery systems, and personnel required to fly/ control the UA.

Unit Maintenance Test Pilot (UMTP) *

A pilot authorised to fly an aircraft after aircraft maintenance has been conducted as required by Instructions for Continuing Airworthiness (ICA) to check aircraft serviceability. (Refer to glossary entry for `Maintenance Check Flight'.)

Unpopulated Area *

A geographic area which contains no people, including no Defence personnel and no civilian persons.

Validate *

Confirmation, through the provision of objective evidence, that the requirements for a specific intended use (ie outcome) or application have been fulfilled.

Variant *

A variant of an aircraft or system is derived from a ‘model’. For example; the C–130J is a model of the A-97 Hercules type, and the C–130J–30 is a variant of the C–130J model.

Verify *

Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled.

Warbird, Historic And Replica Aircraft (WHRA) *

A non–Defence registered aircraft that is an ex-armed forces (Warbird) aircraft, a historic aircraft or a replica aircraft.

Weapon

Any device, whether tangible or intangible, designed or intended to be used in warfare to cause:

a. injury to, or death of, persons; or

Superseded

b. damage to, or destruction of, objects.

Weight And Centre Of Gravity Schedule

Weight and centre of gravity schedule - This is an EMAR term and is equivalent to a weight and balance statement.

Wet Lease *

A lease where an organisation provides Defence with an aircraft, crew, maintenance and insurance for Defence tasking.

Superseded

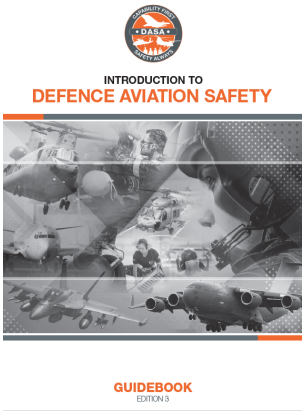
Other Manuals and Guides



[Introduction to Defence Aviation Safety](#) (IDAS) Guidebook

The Introduction to Defence Aviation Safety Guidebook is issued by the Defence Aviation Authority to familiarise those working in Defence aviation with the Defence Aviation Safety Framework and Program. The Guidebook describes the imperative for Defence's approach to Aviation Safety as well as the domestic and international context. It identifies the responsibility of Defence aviation commanders and managers to ensure safety in contrast to the independent safety assurance role of the Defence Aviation Safety Authority (DASA). The Guidebook includes a short description of each part of the Defence Aviation Safety Regulation and the corresponding authorisations issued by DASA.

[Defence Aviation Safety Design Requirements Manual](#) (DASDRM)

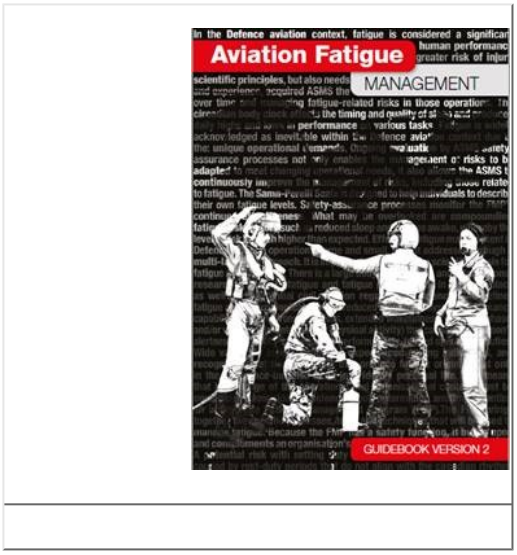
The DASDRM prescribes design requirements for aircraft systems and functions that are necessary to achieve safe flight in Defence's proposed configuration, role and operating environment. It also prescribes additional design requirements that may further improve the level of safety, and that should be implemented where reasonably practicable. In each case, the DASDRM identifies the hazard(s) that the design requirement is intended to treat, to provide a basis for informed risk management where an aircraft design fails to meet the design requirement.

[Aviation Non-Technical Skills](#) (NTS) Guidebook

Available via Intranet Only

This guidebook is designed to introduce the reader to human factors consideration such as human performance, error and violation, safety culture and specific NTS such as situation awareness, decision-making, communication, leading and working in teams and managing stress and fatigue.

Superseded



Defence Aviation Fatigue Management (DAFM) Guidebook

The *Aviation Fatigue Management Guidebook* provides guidance on meeting obligations in relation to fatigue management within the Defence aviation context. More broadly, this guidebook seeks to familiarise Defence aviation personnel with contemporary concepts of fatigue management and to provide practical guidance for implementation in day-to-day operations. While parts of the guidebook focus on considerations specific to select Defence aviation occupations, the themes and concepts remain applicable to all operating contexts.

Defence Aviation Safety Manual

Available via Intranet Only

This manual contains the Defence-approved corporate policy, procedures and guidance to be used by Defence personnel involved in all areas of aviation safety management. The DASM is sponsored by DFSB and endorsed by individual Service command authorities.

Superseded

Portal User Guide

Introduction

To provide feedback on the Policy Portal web interface, or to ask a question about it, please email dasa.dasr@defence.gov.au. For all queries related to DASR change requests, including suggestions and clarifications, please submit a DASR Form 111 located under DASR Forms.

Web Browser Requirements

The recommended web browsers are Microsoft Edge, Mozilla Firefox and Google Chrome. Internet Explorer and Safari should not to be used as they do not properly display paragraph numbers.

Change bars

Change bars on the far right-hand side of the text are used to identify text that has been amended in the most recent DASR release. A change bar to the right of any GM or AMC inircates amended text within the GM or AMC. Change bars are not applied to editorial changes.

Printing

To print, use the print button at top right (see image below). This will print the regulation the user has open and any AMC or GM that has been opened prior to clicking print. The print function works best in Microsoft Edge and Google Chrome.

Tailoring of European Military Airworthiness Requirements

Defence has tailored the European Military Airworthiness Requirements (EMAR) to produce the Initial and Continuing Airworthiness DASR. 'Green' text identifies wording that differs from the source EMAR, except where the difference is editorial in nature. The titles of DASR-unique regulation clauses, or new elements of Acceptable Means of Compliance (AMC) and Guidance Material (GM), are appended with '(AUS)'; e.g. DASR 139.1 - General (AUS).

Navigation

There are two methods to navigate the DASR:

1. Using DASR Structure diagram:

Superseded

- The DASR home screen includes the DASR structure in a diagram format. This can be used to navigate to the desired regulation as each box contains a hyperlink to the respective regulation.

2. Using Table of Contents

- The table of contents on the left hand side of the screen can be used to navigate to regulation groupings, and to drill down to individual regulations.

Viewing Acceptable Means of Compliance and Guidance Material

To view any AMC or GM published against regulation clauses, click the blue AMC or GM buttons such as these: AMC GM.

Expand/Collapse All

The Expand/Collapse all function when selected will expand all AMCs and GMs with the regulation and then collapse if selected again.

Note: Depending on the size of the regulation this may take a moment to occur.

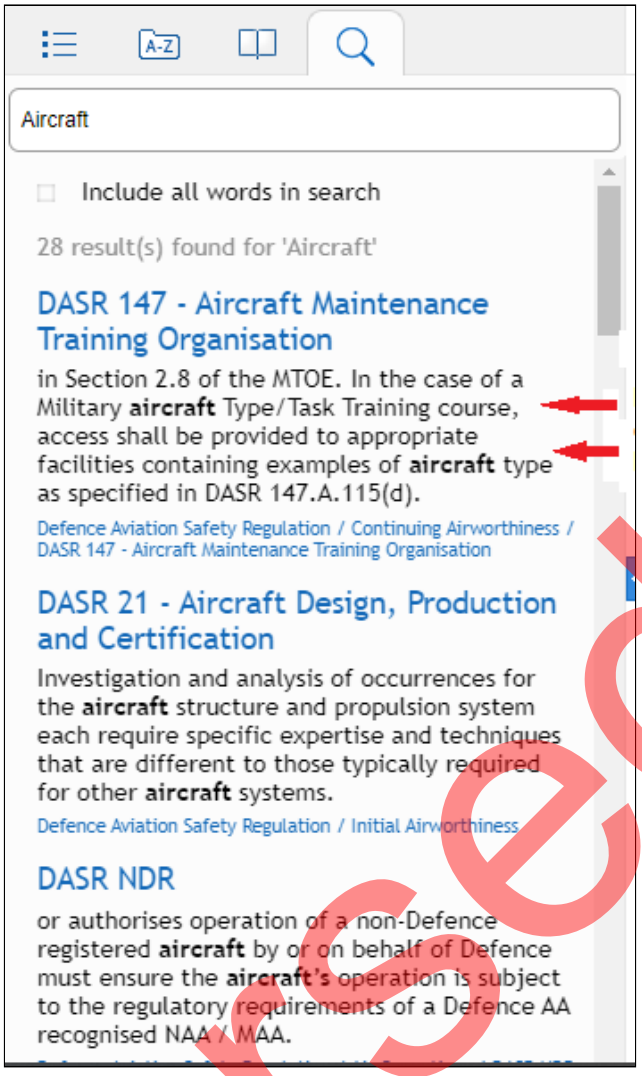
Search function

A search field is located at top right. This can be used to search the entire DASR for single term or a phrase. If multiple words are searched, the search tool will display the multiple words first then each word individually. To carry out explicit an search with multiple words use single or double quotes (‘ or “) at the beginning and end; e.g. ‘Hazardous Propulsion System Effect’ or "Hazardous Propulsion System Effect".

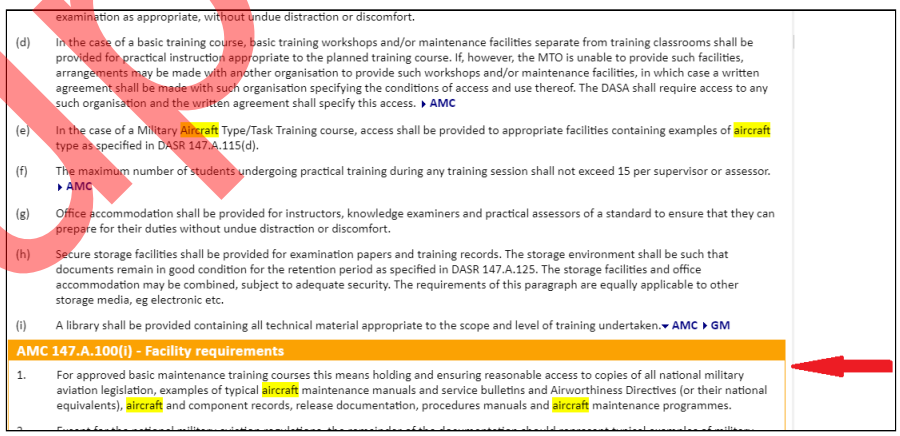
Tips for searching:

After a word or phrase has been searched, the search results will only show the regulation where that word or phrase appears, as shown below.

Superseded

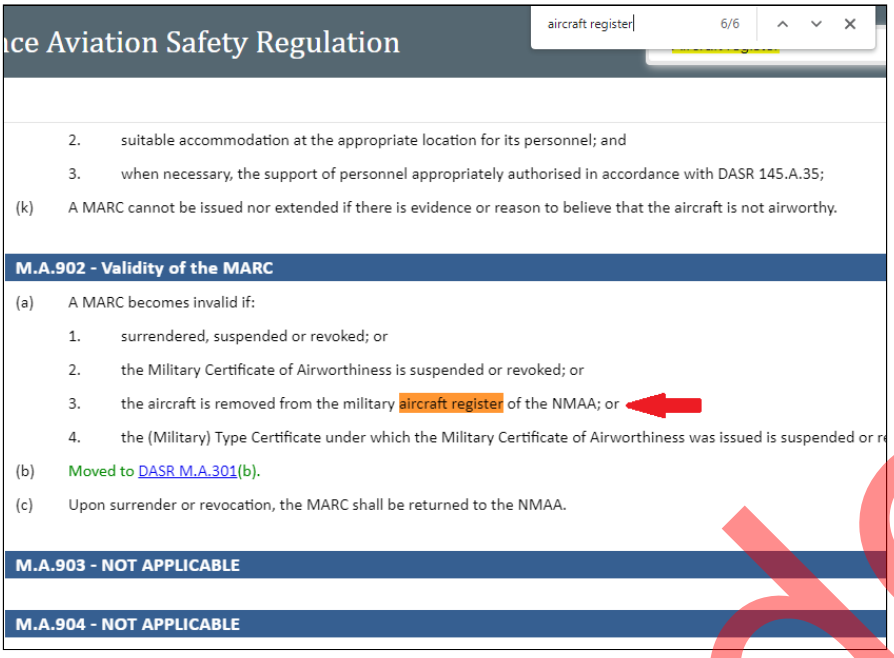


Once you have selected the regulation you wish to view, your search term will be highlighted in yellow. Any AMC or GM containing the search term will automatically expand.



To step through all instances of the search term within the page, use your web browser's search function (usually CTRL + F).

Superseded



Hyperlinks

Some Hyperlinks within the Policy and Guidance Portal are only available on the Defence Protected Network (DPN).

Glossary

The Glossary of Terms is linked from the menu at left.

Offline version

To create an offline version, use the print function located on the top right corner and print to PDF.
